## INDEX OF CONTENTS.

JANUARY TO JUNE, 1896.

## A

ABERDEENSHIRE, technical instruction in horticulture in, 302  
 Abies amabilis, 621; *A. nobilis*, a fine, 790  
 Adiantum Farleyense, rapid growth in Greece of, 760  
 Adonis amurensis, 240  
 Aërides vandarum, 240  
 Africa, the Cedar of Central, 72  
 Agave americana, in flower at North-down, Margate, 17  
 Agavo laxifolia, 735  
 Agricultural depression, 706; research, 488  
 Aldenham House Gardens, Elstree, 295  
 Alpine garden, the, 643  
 Alpinia nutans, 300, 369  
 Altai flora, the, of Western Siberia, 45  
 Amateur's garden, an, 53  
 America, gardeners in the United States of, 302  
 America, the Carnation in, 461  
 American Grape-vines in Melbourne, 105  
 Amherstia nobilis, 610  
 Amsterdam, phytopathological institute at, 84  
 Anachronisms, botanical, 735  
 Androgynous cones, 769  
 Anemone sylvestris fl.-pl., 739  
 Anguloa uniflora var., 423  
 Annuals at Brayfield, 54  
 Antarctic exploration, 113  
 Anthurium Chamberlaini, 239, 610; *A. Gustavi*, 239; *A. Sanderianum*, 50  
 Anthuriums, 465; at Shipley Hall, Derby, 528  
 Ants, how to destroy, 708  
 Apiary, the, 523, 613, 677, 733  
 Apple, Annie Elizabeth, 562, 620, 658  
 Apple blossoms in East Anglia and about Edinburgh, 590  
 Apple, bush of Cox's Pomona, at East Sutton Park, 241; bush of Nonsuch, 137; Dutch Mignonne, 146; Goodwood Pippin, 398; Peagood's Nonsuch, espalier tree of, at East Sutton Park, 303; the Baltimore, 56  
 Apples, colour in, 20, 562; late blooming, 590; Royal Late Cooking and Lord Hindlip, 114; dessert, special prizes for, 462; the best-flavoured, 552  
 Apples, special prizes for dessert, 780  
 Apricot, the chemical composition of the, 728  
 Apricots from the Cape, 113  
 Aquilegia Skinneri, 86, 441  
 Aralia edulis as a vegetable, 737  
 Arcaearia cones, 243  
 Arbor-day in Japan, 204  
 Arderne's, Mr., garden at Cape Town, view in, 143  
 Arddarroch, Odontoglossum from, 421; sale of Orchids at, 765  
 Aristolochia gigas Sturtevantii at Washington, 73  
 Arle Court, Cheltenham, 582  
 Art and science, a summer school of, 526  
 Artichoke, the Jerusalem, 40  
 Arundinaria nobilis in the grounds of Menabilly, 700  
 Asafetida plant, the, 680  
 Asarum maximum, 296  
 Ascott, the gardens and grounds at, 165  
 Asparagus, a rational way of culti-

vating, 488; the best time and method of feeding, 551; feeding, 519, 620; fly, the, 765; from Melbourne, 105; the feeding of, 620  
 Asplenium Perkinsi, 8  
 Ash, the flowering, how to graft, 698  
 Ashlands, Newchurch, 520  
 Asters and Zinnias for bedding, 454; for seeding, 556  
 Aucuba japonica in berry, 465, 620  
 Auricula, 84, 371, 551, 674; gossip, 437  
 Auriculas, border, 560; on raising seedling, 550  
 Australia, fruit from, 737  
 Azaleas, Indian, grafted on the Rhododendron, 763

## B

BACTERIA in Carnations, 549  
 Bamboos in General Hutchins's garden, Bournemouth, 524; Japanese names for, 180, 208  
 Bardfield Oxlip, the, 620  
 Barron's, Mr. A. F., retirement, 17; presentation to Mr. A. F., 524; testimonial, the, 365  
 Battersea Park in May, 738  
 Beaumontia grandiflora, 735  
 Bedding, the methods of summer, 610  
 Beech trees, the grafting of, 672  
 Bees swarming early, 560  
 Beet-sugar in Germany and France, 427, 768  
 Begonia Duchess of Fife, 711; *B. Ortigiesii*, 207; *B. unbraculifera*, 172  
 Begonias, 305; fimbriated flowers of, 682  
 Belgium, horticultural schools in, 640; notes from, 19, 230, 369  
 Benefit and Provident Society, United Horticultural, annual meeting of the, 338  
 Benevolent Institution, Gardeners' Royal, 51, 141, 143, 174, 176, 259, 463, 492, 735; annual dinner of, 711; Devonshire branch of, 338; Wolverhampton Auxiliary, the, 396  
 Berberis buxifolia, 519; *B. stenophylla* ×, 671  
 Berlin Industrial Exhibition, 50, 699, 759, 782; collection of drugs in the, 648  
 Bifrenaria tyrianthina, 174  
 Birch trees, the grafting of, 673  
 Birds, early nesting of, 304; and injurious insects, 711; wild, and the need of protecting them, 87, 455  
 Bitter Oranges, 527  
 Bloom and berry on tree and shrub, 710

BOOKS, NOTICES OF:—Agenda Horticole (*M. Henry*), 113; American Florists' Co. Directory, 616; American Gardening, 142; An introduction to the Study of Sea Weeds (*G. Murray*), 240; Annals of the Royal Botanic Garden, Calcutta, vol. v., 781; Annual Bulletin of the Société Française d'Horticulture de Londres, 616; Australian Grasses, vol. i. (*R. Turner*), 52; Beeton's New Dictionary of Everyday Gardening, 366; Botanical Magazine wrappers, some old, 389; Botanical Magazine, 735; Botany of Yakutat Bay, Alaska (*U. S. National Herbarium*), 206; British Fungus Flora

(*Geo. Massee*), 179; British Mycetoza (*Arthur Lister*), 333; Botaniker Adressbuch, Botanists' Directory (*J. Dörfler*), 559; Bulletin de L'Association pour la Protection des Plantes, 737; Cassell's History of England, 178; Chrysanthemum Catalogue (*O. de Meulenaere*), 616; Cocoa, All about it, 2nd Ed. (*Historicus*), 766; De Conservanda Bona Valudine Opusculum Scholæ Salernitanæ ad Regem Angliæ, 579; Dictionnaire Pratique d'Horticulture et de Jardinage, 56, 174, 269, 558; Die Natürlichen Pflanzenfamilien, 129th section (*Engler & Prantl*) 269; Everybody's Guide to Poultry-keeping (*Donal Sherraton*), 526; Flora Capensis, 524; Flora of British India, part 21, 558; Forstbenutzung (*Gayer*), 697; Greenhouse and Stove Plants (*Th. Baines*), new edition, 708; Hand-list of Orchids Cultivated in the Royal Gardens at Kew, 366; Hand-list of the Species and Varieties of Conifers grown at Kew, 365; Icones Plantarum, 708; Index Kewensis, the manuscript preserved, 614; Influence of Rain and Spray on the Form of Leaves (*Regenfall & Blattgestalt*), 766; Insect Life (*F. Y. Theobald*), 366; In the Guinea Forest (*J. Rodway*), 392, 433; Introduction to the Study of Fungi (*M. C. Hansen*), 83; The Orchid Hybridists' Handbook (*A. E. Hopkinson*), 206; The Silva of North America, vol. viii. (*C. P. Sargent*), 52; The Structure and Development of Mosses and Ferns (*D. H. Campbell, Ph. D.*), 206; United States National Herbarium, 676; Wells' Book on the Culture of the Chrysanthemum (*W. Wells*), 240; Wild Flowers of the North-eastern States (*Ellen Miller and Chittie Whiting*), 113

Borer, Raspberry-stem, 620  
 Bosahaa, view in the garden at, 364  
 Botanic Fiction, a, 176, 736  
 Botanical anachronisms, 736; discoveries of Delavay, 615; discoveries, recent, in New Zealand, 43  
 Boegainvillea glabra Sanderiana, 610  
 Boegainvilleas, the culture of, 730  
 Boxes, railway packing, 304  
 Brangwin's garden roller, with scraper, 712  
 Brazilian Orchids, the treatment, 609  
 British Ferns, 755  
 Broccoli, 527; culture and protection, 106  
 Brodiaea californica, syn. Austinæ, 790; *B. Howelli* lilacina, 767  
 Brookfield, Hathersage, Daffodils at, 618  
 Brussels exhibition for 1897, 19  
 Brussels Sprouts, fasciated, 499  
 Budding of the Horse-Chestnut, 672  
 Buds on a seedling plant, 86  
 Bulbophyllum, a remarkable, 726; *B. multiflorum*, 294  
 Bulbs, imports of Japanese, 270; in herbaceous borders, 464, 465  
 Burrs, in the Ginkgo, 175; a new use for Burdock, 764

## C

CABBAGES, early, 658; spring, bolting, 590, 681, 704, 738, 767  
 Caladium, the, 137  
 Calanthe × Bryani, 50; *C. × William Murray*, 50  
 Calanthes, winter-flowering, 80  
 Caltha palustris, honey-glands of, 564  
 Camellia, the double white-flowered, 358  
 Campanula, a new, 648; *C. mirabilis*, 710; *C. Regina*, 681  
 Camphor Al., a Chinese product, 50  
 Cannas, hybridised with Hedycheiums, 112  
 Canees, horticultural meeting at, 422  
 Canlif, extensive exhibition at, 558  
 Carnation and Picotee, 674  
 Carnation rust and the Bordeaux Mixture, 270  
 Carnation and its culture, the, 52, 135, 350, 681

- Carnation, the, 84, 438, 551; from seed, 640; in America, 464  
 Carnations at Bookham, 786  
 Carnations, bacteria in, 549; diseased, 437; Souvenir de la Malmaison, 434  
 Carrot, an extraordinary, 105  
 Castleton House, Orchids at, 609  
 Catalpas, the, 423  
 Catasctum scurra, 294  
 Cattleya labiata, white variety, 133; with two leaves, 13  
 Cattleya  $\times$  Empress Frederick, 495; C. Mossiae, double growth on a, 55  
 Cedar, the dwarf Lebanon, 563  
 Cedar, the, of Central Africa, 72  
 Cedrus Libani nana, 563  
 Cenolophon vitellinum, 638  
 Cereus Cumingii, 390; C. Digneti, 390  
 Cheltenham syringe, the, 565  
 Cherry trees, Morello, at Scone Palace and Cullen, 56  
 Cherries, a novelty in, 429; the culture of, 41  
 Children and natural history, 766  
 Chinese Mustard, curled, 333  
 Chiswick, Saturday half-holiday for employes at, 583; vegetable trials at, 619  
 Chrysanthemum, the, 11; principal chemical constituents of, 557; at Hong Kong, 76; late-blooming, single-flowered, 12; notes on the culture of, 304  
 Cineraria, a fasciated, 463; origin of the garden, 641; origin of the, 239, 302, 335, 560, 620  
 Cineraria, the allies of the, 460; Hybrids, 791  
 Clay subsoil, newly-dug, 592  
 Clematis montana, 790  
 Climate and tree-growing, 730  
 Club in Cabbage, 708  
 Cologyne cristata, 241; C. flaccida, 241; abnormal flower of, 462; C. Rumphii, 452  
 Coffee in Central Africa, 366  
 Collecting tour, a, in Jamaica, 197, 263  
 Colonial notes, 105, 366, 520, 767  
 Colour in Apples, 20, 437, 465; and Pears, 146, 562  
 Colouring of flowers, the, 620  
 Colouring, the, of flowers and fruit, 146  
 Coltsfoot, first flowers of, 239  
 Combretum purpureum, 738  
 Committees, the views of the Royal Horticultural Society, 80  
 Cones, androgynous, 709  
 Conferences at the Royal Botanic Society, 492  
 Conifers, flowers of, 556, 586; grafting, 463; insect pests of, 486; some diseases of, 553  
 Conservatory at Ewthorpe, Bourne-mouth, the, 359  
 Convolvulus Cucorum, 738  
 Coomber, Mr. W., presentation to, 83, 332, 586  
 Coprosma Baueriana, the propagation of, 207  
 Cork in Spain, 558  
 Cornell University, syllabus of debates for advanced students at, 239; horticulture at, 117  
 Cornish Broccoli, 398; garden, early flowers in a, 176  
 Coruus Koussa, 782  
 Costa Rica and its Orchids, 548  
 Cotoneasters, the grafting of, 673  
 Cotton-seed oil, 646  
 Council, election of the, of the Royal Horticultural Society, 115  
 Covent Garden, fruit supply of, 21, 87, 116  
 Crabs, the propagating of ornamental, 640  
 Cranberries, ripe, in January, 141  
 Crataegus mollis, 610; C. tanacetifolia, 202  
 Crimea, fruit preserving in the, 188  
 Crinum Powellii alias C. Rosemanni, 644  
 Crocus Creweii, 208  
 Crows and gardens, 45  
 Cucumber, a variegated, 563  
 Cucumbers as grown for market, 610  
 Cultural memoranda, 46  
 Cycads from cuttings, the propagation of, 332  
 Cycas, sale of, of George Washington, 50  
 Cyclamen, the culture of the, 270  
 Cyclamens, unhealthy, 146  
 Cydonia japonica, the grafting of, 674  
 Cymbidium eburneum, 359; C. Tracey-anum, 10  
 Cyperus distans, 394  
 Cypripedium Burtoni  $\times$ , 20, 40; C. callosum Sanderæ, 726; C. Chamberlainianum, 640; C.  $\times$  Chas. Rickman, 132; C. Elliotianum, 358; C. hirsutissimum, abnormal, 518; C. Sanderianum, 329; C. spectabile, poisonous properties of, 588; trimmerous, a, 238; C. Victoria Maria, 294; C. villosum Truffauti, 104  
 Cypripedium, the Botany of the Genus of, 238  
 Cypripediums at Kew, 204  
 Cytisus albus, 671; C. Ardoini, 698; C. scoparius var. Andreanus, 671, 682, 791
- D**
- DAFFODILS, appearing blind, 177, 208, 242; at Brookfield, Hathersage, 618; poisoned by soot, 495; trumpet, in the Landes, 451  
 Dahlia certificates, the, given by the National Society, 116  
 Dahlias, 136; D. cactus, 242  
 Dasylium acrotrichum, 204  
 Dewish improvements, suggested, 708  
 Declaration, plants for, and exhibition, 261  
 Delavay, the Abbé, some of the botanical discoveries of, 615  
 Dell, The, Egham, Orchids at, 484  
 Dendrobium bigibbum, 334; D. cymbioides, 581; D. cariniferum, Highfield House var., 699; D. Dalhousieanum, 272; D. nobile intermedium, 264; D. nobile, unpruned specimen of, 56; D. nobiliss, 359; D. Ruckeri, 240; D. sarmentosum, 240; D. speciosum, 230; D. Wardianum, 116, 264; D. W. at Welham Hall, Keford, 304; D. W. and others, the culture of, 75, 241, 297; D. W. var. Lowii, 230; D. Wiganii, 553  
 Dentzia gracilis, culture of, 584  
 Dianthus attacked by grubs, 146  
 Dimorphotheca Eckloni, 296  
 Diospyros virginiana, 790  
 Diplosis pyrivora, 400  
 Diseases of Conifers, 553  
 Dombeya Wallichii, 169  
 Douglas Fir, 272; spar at Kew, 175  
 Brought in Massachusetts, U.S.A., 679  
 Drying, experiment in fruit, 238  
 Dyer, Mr. W. T. Thiselton-, created L.L.D. by the University of Glasgow, 492
- E**
- EATON Hall Gardens, 71  
 Echinocactus peninsule, 390  
 Edinburgh Royal Botanic Garden, 305  
 Ehret, G. D., 558  
 Elm, the winged, 453, 495, 527  
 Elms, the grafting of Weeping and other, 699  
 Elmsfield House, Maidstone, 609  
 Embankment Gardens, the, 82  
 Enville, the gardens of, 199  
 Environment, plants and their, 678  
 Epidendrum  $\times$  elegantulum, 361  
 Epiphyllum truncatum, 9  
 Episcia densa, 735  
 Epping Forest, 174  
 Eranthemum reticulatum, 735  
 Erica eodonodes, 487; E. Wilmoreana, 200  
 Eridge Castle, damage by fire to, 269  
 Eriaceæ paucens, 698, 738  
 Essex County School of Horticulture, 206, 238  
 Eucharis grandiflora at The Garnons, Hereford, 144, 177  
 Eupatoriums, 367  
 Eupomatia Bennettii, 305  
 Evolution, plants and the process of, 678  
 Exhibitions, the crowding of herbaceous plants at, 560; the use of horticultural, 515  
 Experiments on transpiration, 360
- F**
- FALCONER, Mr. W., appointment to the superintendency of the Pittsburg Park System, 334  
 Falkland Park, South Norwood Hill, 39, 73  
 Farmers and fruit-growing, 48, 114, 145, 177, 208, 456  
 Fasciated Brussels Sprouts, 499  
 Feeding Asparagus, 620  
 Female gardeners at Kew, 174  
 Fern-stealers punished, 142  
 Fern varieties, British, their rarity, 42  
 Ferns, British, 755; filmy, for the Wardian case, 76; Chitral, 302; hardy, 335, 432; in exposed positions, 242  
 Fernères en-Brie, Phalenopsis in flower at, 330  
 Ferula Asafetida, 680  
 Finger-and-Toe, experiments in regard to, 332  
 Finlaint, early-flowering shrubs at, 519  
 Fir, the Douglas, 272, 527  
 FI RA, the Altai, of Western Siberia, 45  
 Florists' flowers, 11, 84, 107, 136, 304, 371, 437, 486, 551, 582, 611, 640, 674, 713  
 Florists' flowers, raising seedling, 550  
 Flower-beds, effective combinations for, 681  
 Flower garden, the, 14, 47, 79, 108, 139, 170, 203, 234, 266, 299, 330, 361, 363, 427, 458, 490, 522, 555, 584, 613, 644, 677, 704, 733, 760, 787  
 Flower garden, the formation and maintenance of a, 325  
 Flower mission, a, 738; shows, and their uses, 515  
 Flowers as food, 55; by post, 679; from Scilly, 82; Colouring, 791  
 Flowering shrubs, 465, 466  
 Forestry, 13, 104, 145, 167, 200, 329, 362, 456, 553; instruction in Scotland, 168  
 Forest utilisation, 697  
 Forsythia suspensa, 454, 566  
 France, horticulture in the North of, 784  
 Freesia culture at Sufton Court, 272  
 Freesia refracta, 242  
 Freesias, 457; some fine, and others, 392  
 Frost, the, effect of on plants, 393  
 Frost, the great, of 1895, at Kew, 169, 196, 231  
 Fruit, bottling made easy, 495; cordons, 12; culture about Smyrna, 669; culture by farmers, 48, 114, 145, 242, 272, 456; drying, an experiment in, 238; drying, 607, 766; experiments at Woburn, 642; from Australia, 737; growing and farmers, 208; preserving in the Crimea, 198; prospects, 590; in South Wilts, 527; supply of Covent Garden, 21, 87, 116, 166; trees, bush, 769; spraying, 270; insects on, and spraying, 710  
 Fruits, &c., a year's imports of, 82; and flowers, new system of distribution of, 769; from Tasmania, 302, 588, 648, 708; thinning choice, 532  
 Fruits, hardy, see Hardy Fruit Garden  
 Fruits under glass, 14, 47, 78, 109, 139, 171, 203, 235, 266, 299, 330, 363, 395, 426, 459, 491, 522, 555, 585, 612, 645, 676, 705, 733, 761, 786
- G**
- GAME and timber, 87, 176, 329  
 Game-covert, undergrowth for, 23, 145, 329

## NOTICE TO ADVERTISERS.

In consequence of the alteration of the hour of going to Press, consequent on the large increase in the circulation, it is imperative that all Copy for Advertisements should be received BY FIRST POST THURSDAY MORNING at the latest.

### Seeds—Their Cost and Quality.

IT IS A FACT all can save 3d. and 4d. in a lb. by having their seeds (of far superior quality and heavier crops) direct from us, the actual growers, on the best spot in the world for producing them, thus getting that which is so lavishly expended to force a sale for the ordinary bought here, there, and everywhere—inferior foreign productions. The secret is to get supplied direct from the actual producers (300 acres). Most practical Catalogue free to coming customers.—H. CANNELL AND SONS, Swanley, Kent.

**SUPERB ORCHIDS, CHEAP.**—Thousands to select from. Write for LIST, free. P. MOARTHUR, The London Nursery, 4, Maids Vale, London, W.

**TECOMA SMITHII.**—The finest new flowering plant; as easily managed as a Chrysanthemum. It produces in Autumn large heads of brilliant red and yellow blossoms. New seed of all Seedsmen.

**SEED POTATOS.**—For Sale, Myatt's Prolific (True), 80s. per ton. G. F. YOUNG, Swinhead Abhey, Near Boston.

**FOR SALE, or Exchange, Geraniums, Calceolarias, Marguerites, Chrysanthemums,** for Roses from open ground. Apply at once.—CHIPPERRIELD, Florist, Hampton Hill.

**TO THE TRADE.**—CUCUMBER SEED, Covent Garden Favourite, Rochford's variety, warranted true, 10s. 8d. per oz., can also supply Plants same variety. J. A. MARSHALL, Holly Bush Nursery, Potters Bar, N.

**SUTTONS AMATEURS' GUIDE IN HORTICULTURE** for 1896 is now ready.

**SUTTONS' AMATEURS' GUIDE IN HORTICULTURE** for 1896 is the most complete SEED CATALOGUE issued.

**SUTTONS' AMATEURS' GUIDE IN HORTICULTURE** for 1896 is profusely illustrated with 211 illustrations, principally photographic.

Price 1s., post-free. GRATIS TO CUSTOMERS FROM SUTTON AND SONS, THE ROYAL SEEDSMEN, READING.

**B. S. WILLIAMS & SON** have posted their ILLUSTRATED SEED CATALOGUE for 1896 to all their Customers. Another copy will be forwarded, post-free, on application, to any who have not received a copy. Victoria & Paradise Nurseries, Upper Holloway, London, N.

**CHOICE GERMAN FLOWER and VEGETABLE SEEDS.** CATALOGUES free on application. FEED, REMER, Seed Grower, Quedlinburg, Germany.

**NOW IS THE TIME TO PLANT PEONIES,** PYRETHRUMS, and Delphiniums. Catalogue of KELWAY AND SON, Langport, Somerset.

**NOW READY! KELWAY'S MANUAL OF HORTICULTURE and AGRICULTURE** for 1895 is being posted to all Customers of recent date. A copy will be sent gratis to others desiring to become Customers. To those not ordering goods the charge is 1s., deducted from order. 180 pages quarto, illustrated, and with copious notes as to cultivation and other matters relating to the Garden and Farm. KELWAY AND SON, Langport, Somerset.

**LILIAM AURATUM.**—Importation just to hand in splendid condition; good flowering bulbs, 4s. per dozen; magnificent bulbs, 8s. per dozen, packed free for cash with order.—H. HEADLAND & CO., Old Road, Gravesend.

**NEW MELON for 1896.**—"The Lady," raised by Mr. Oweo Thomas, the Royal Gardens, Windsor, from whom we have secured the entire Stock. Per sealed packet, 1s. 6d. and 2s. 6d. Full particulars in our New Illustrated Catalogue, No. 459, now ready. DICKSONS Royal Seed Warehouses, CHESTER.

Demy quarto, printed on fine paper in grey, gilt top. Price, £1 11s. 6d.

**THE ART and PRACTICE OF LANDSCAPE GARDENING.** By H. E. MILNER, A.M.I.C.E., F.L.S. With Etched Illustrations and Hand-coloured Plates. To be obtained from the Author, 7, Victoria Street, S.W.; or, from the Publishers, SIMPKIN MARSHALL & CO., Ltd.

**HEINEMANN'S CELEBRATED SEEDS.**—Seed for CATALOGUE, post-free. Seeds, post-free. F. C. HEINEMANN, Seed Grower, Erfurt, Germany.

**TO THE TRADE.**—We are in a position to make advantageous offers of Garden Peas, including Sharpe's Queen, Sharpe's Triumph, English Wonder, American Wonder, and William Hurst. Samples and prices on application to—CHARLES SHARPE & CO., Limited, Slough.

**TO THE TRADE.** **NUTTING AND SONS** have posted their ANNUAL TRADE CATALOGUE to all their customers. If not duly received, please inform them. Seed Warehouses, 106, Southwark Street, London, S.E.

**ASPARAGUS, for Forcing.**—Five years old, splendid root, 12s. 6d. per 100; extra fine, 6 years old, 15s. per 100. On rail, cash with order. My Asparagus always makes top price at Covent Garden. J. J. CLARK, Market Gardener, Goldstone, Brighton.

**FOR ORCHIDS** of every description at Reasonable Prices, and efficient men to cultivate them apply to—W. L. LEWIS AND CO., Southgate, London, N. PRICE LIST free.

**WANTED, Five hundredweight of Tubers of STACHYS TUBERIFERA.** Sample and prices to—HARRISON AND SONS, Seed Growers, Leicester.

**BARR'S SEEDS.—UNEQUALLED.** VEGETABLE SEEDS, best in the world for growth. FLOWER SEEDS.—Upwards of 2000 species and varieties. BULBS.—Gladioli, Lilies, Anemones, Ranunculus, Tigridias, &c. PLANTS.—Hardy Perennials and Alpines for beds, borders, rockwork, and to cut for vases and bouquets. DESCRIPTIVE CATALOGUES of above sent free on application. BARR AND SON, 12, King Street, Covent Garden, London.

**To the Trade.** A COPY of our WHOLESALE LIST of AGRICULTURAL GARDEN and FLOWER SEEDS for 1896 has now been posted to all our customers. In case of miscarriage, another copy will be promptly sent on application to—JACOB WRENCH AND SONS, Ltd., 39, London Bridge, City.

**GOLD MEDAL  
CHRYSANTHEMUMS.**

My Novelties for 1896 helped materially to win for me during the past season **THREE GOLD MEDALS**, and the **PRESIDENT'S PRIZE** of the N.C.S. These, together with the varieties raised by Mr. C. E. SHEA, Mr. H. BRISCON-IRONSIDE, and other raisers, which I shall distribute, will be the finest set ever introduced in one season.

My **SUPPLEMENTARY LIST**, containing a full description of the above, and other Novelties of the Season, is now in the press, and can be had post free on application. Customers will receive a copy of this when it is ready.

My **CHRYSANTHEMUM GUIDE**—The most complete work on culture. Post free, Eight Stamps.

ALSO IN PREPARATION, THE

**CHRYSANTHEMUM ALBUM.**

By H. J. JONES,

Containing **THIRTY-SIX ILLUSTRATIONS** of NEW CHRYSANTHEMUMS from photographs. Every grower should possess a copy, as this will enable him to select varieties from the actual representation of the flowers. This valuable work will be produced at great cost, and can be obtained of the Author, post free, 2s. 6d. each.

**H. J. JONES,**  
**Ryecroft Nursery, LEWISHAM, S.E.**

**NOVELTY FOR 1896.**

Pure White, Large-Flowering, Single Chrysanthemum,

**"EWAN CAMERON."**

First class Certificate, National Chrysanthemum Society, 1895.

An exceedingly dwarf-growing variety, only about 18 inches, and very bushy; large pure white single flowers, which may be said to completely cover the plant; it is also invaluable for bouquets and other choice floral-work; grown in 5 or 6-inch pots, it makes a very nice table-plant.

Cuttings, 1s. each; Rooted Plants, 2s.

Sent free by post. Cash only.

Press Notice.—Gardeners' Chronicle, Nov. 16, 1895:—"Certificate of Merit to E. C. GOBLE, for Ewan Cameron, a pure white, finely-formed single variety, of dwarf growth, and very free, the award being made to it as a highly promising market variety."

**E. C. GOBLE,**  
**WALCOT NURSERY RYDE, ISLE OF WIGHT.**

**WEBBS' STERLING NOVELTIES**

**BRUSSELS SPROUTS (New Prizetaker).**

For exhibition purposes or culinary use, this new variety is unexcelled. The stem is covered with large firm sprouts of the very finest quality.

1s. per packet, post-free.

**MELON (NEW INTERNATIONAL).**

NOW OFFERED FOR THE FIRST TIME.

This splendid new Melon has been raised from a cross between President and Hero of Lockinge. The fruit is somewhat oval in shape, with dark yellow skin, which is handsomely netted. The flesh, which is pale green, is exceedingly deep and of most delicious flavour.

2s. 6d. and 5s. per packet, post-free.

**TOMATO (NEW REGINA).**

This valuable novelty is early and very prolific; it sets its fruit well out of doors, and also under glass. The fruit is smooth, somewhat round in shape, of beautiful deep colour and delicious flavour.

1s. 6d. and 2s. 6d. per packet, post-free.

## Williams

### STERLING NOVELTIES for 1896.

Our own introduction—now offered for the first time.  
Post Free.

#### BEAN, DWARF FRENCH, WILLIAMS' EARLIEST OF ALL.

This new variety is the earliest French Bean in cultivation. It can be forced a good deal earlier than any other variety. It is a splendid variety for pot culture as well as for outdoor work. It grows from 18 to 21 inches high, is a strong vigorous grower with a good constitution; the pods are long, broad, and fleshy, and of a green colour. They are very tender when cooked, and of excellent flavour.  
Per packet (½ pint), 1s. 6d.

#### TOMATO, "WARRIOR"

This magnificent variety is a very free setter and good cropper, producing its fruits in great clusters. The fruit is large, round, and without ribs. The flesh is of a crimson colour, firm, with flavour of the finest quality. As the fruit is exceedingly symmetrical in shape, it will prove very valuable as an exhibition variety.  
Per packet, 1s. 6d.

#### NEW GIANT PRIMULA—PRIMULA SINENSIS FIMBRIATA "Magnum Bonum."

This beautiful variety will form an excellent companion to the Giant White Primula, "Snowball," we sent out last year. We have every confidence in placing it before our Customers. The plants are very sturdy and compact in habit; the flower stem is strong, and rises well above the strong, robust foliage. The blooms are produced in great profusion, of a gigantic size, beautifully fringed, and the colour is a very beautiful shade of a rich deep red.  
Per packet, 5s.

For full descriptions of above see  
ILLUSTRATED SEED CATALOGUE for 1896,  
which will be forwarded, gratis and post-free,  
to all applicants.

GENUINE ONLY FROM SUTTON & SONS, READING.

## A LOST CYPRIPEDIUM.

*Re-discovery and re-introduction*

OF

## CYPRIPEDIUM MASTERSIANUM,

By F. SANDER & CO.,

TOGETHER WITH

## C. Mastersianum superbum (SEVEN PLANTS).

We have searched for upwards of ten years for this grand and very rare Cypripede, and we now offer 5000 plants

WITHOUT ANY RESERVE.

THEIR CONDITION IS SIMPLY SUPERB.  
LEAVES AND GROWTHS ARE PERFECT.

Less than a dozen plants of this rare and charming species exist in cultivation, and from the great number of plants offered, the remarkable variation in the foliage, and our collector's notes, we are confident that many grand surprises will be found among them.

The flowers are large, white, yellow, green, and bronzy-crimson, on purple stems 15 inches high; upper dorsal or standard, concave, nearly orbicular, resembling the labellum of *Catasetum Bungeorothii*. They are of great substance, and last in perfection longer than any other kind.

For Cutting Purposes it is the Best.

It is very Free Flowering.

It is of the Easiest Culture.

For the Hybridist it is a "sine qua non."

Boyers may expect albinos and golden forms among them, as *Sanderæ* among *insigne*, *Sanderæ* among *callosums*, *Hycanum* among *Lawrenceanums*, *bellatulum album* among *bellatulum*. (See paintings, on day of Sale, by our collector's native guide, Swa Buey Kroon, of C. MASTERSIANUM (type), and C. M. SUPERBUM.

### STRATHFIELDSAYE.

A RUN of little more than one hour's duration from Paddington by the Great Western Railway, *via* Reading, lands the visitor to Strathfieldsaye at Mortimer Station—one of the prettiest and best-kept railway stations in the country. Travelling along a pleasant country road, through rich grazings and well cultivated land, for about 3 miles, the policies are reached, and the drive sweeps through a spacious park studded with many picturesque ancestral trees and embellished modern plantations, and thriving examples of *Conifera* and other ornamental subjects. About half a mile from the mansion the drive enters a grand avenue of stately Elms, each about 100 feet high, and many 15 feet or more in girth, standing like a row of gigantic sentinels on either side for some distance, and forming a splendid approach to the home of the great warrior, the late "Iron Duke."

Within the private grounds, we make our way towards the gardens, through a rich wealth of trees and shrubs growing with great luxuriance, and indicating the high qualities of the soil and subsoil for the nourishment of tree life. In the kitchen garden, great improvements have been carried out, and the whole place thoroughly renovated, under the skilful direction of Mr. McHattie, who took charge of the gardens and ornamental grounds in the spring of 1893. Forcing-houses and pits have been rebuilt or thoroughly repaired, exhausted borders renewed, walks remade, worthless fruit trees removed, and their places filled with the best and most productive varieties; and everything has been done that skill and experience can effect to put the place in perfect going order. Neither has the comfort and health of those employed in the gardens been overlooked, as the residences for the gardener and his assistants amply testify. These have been completely remodelled, and all the best sanitary arrangements have been introduced, which tend so much to preserve the health and add to the comforts of the occupiers. As the object of our visit was mainly to see the trees and shrubs, for which the grounds and policies are noted, and of which a fine collection of specimens of about 200 varieties was exhibited at the Conference on Trees at Chiswick, on September 29, 1894, only a hurried glance could be given to the gardens, the houses, and their contents, but it was evident on all sides that fruit, flowers, plants, and vegetables, were liberally responding to the energy and skill displayed in their cultivation. Fruit and flowers, especially *Chrysanthemums*, were of very high excellence.

Accompanied by Mr. McHattie, who is as enthusiastic an arborist as he is an able gardener,

# VEITCH'S GENUINE FLOWER SEEDS, &C.

## PHYSALIS FRANCHETI.

(First-class Certificate R.H.S., October 15, 1895). A novelty of sterling merit, very striking in appearance, producing bright red fruits, 3 inches in length and from 7 to 8 inches in circumference. Very beautiful for Christmas Decoration when cut.

Per packet, 2s. 6d.

## CAMPANULA PYRAMIDALIS COMPACTA (Syon House Variety).

This variety is quite distinct from the older form, being of dwarfer pyramidal habit, with larger flowers and a deeper blue; very sturdy and free flowering.

Per packet, 1s. 6d.

## G. F. WILSON'S BLUE PRIMROSES (New).

Very beautiful and distinct. The flowers range from pale lavender to a deep violet. Per packet, 2s. 6d.

## TOMATO, ALL THE YEAR ROUND (NEW).

First-class Certificate R.H.S., April 23, 1895.

Very superior variety, fruit bright red, of a plum shape, solid, and of high quality. Very prolific, producing clusters at every joint. Suitable for growing under glass, or in the open ground.

Per packet, 2s. 6d.

For full descriptions of the above and other choice Seeds see Catalogue for 1896, forwarded post-free on application.

# JAMES VEITCH & SONS

ROYAL EXOTIC NURSERY,  
CHELSEA, LONDON, S.W.

we proceeded to view the trees in the pleasure-grounds and policies. Entering the grounds from the kitchen garden and turning to the left, we were presently in front of an imposing group of Cedars of Lebanon, twelve in number, the largest of which towers to a height of fully 120 feet, with a massive bole girthing 12 feet at 4 feet from the ground. The Cedars have been planted and grown closely, so that their tall cylindrical stems are denuded of branches to a height of about 70 feet, and present more of the appearance of well-grown Larch stems than that of ordinary Cedars. In the same vicinity were seen some very fine Scots Firs, with the red scaly bark and clean stem that indicate high quality in the timber. To the right of the group of Cedars we entered the pinetum, and the first object to attract our attention was a fine specimen of the Douglas Fir, which however has unfortunately lost its leader in a storm, after attaining a height of about 55 feet. Still, the beauty of the tree has not been marred to any great extent, as it is a fine shapely specimen in vigorous health, and clothed to the ground. Near by are growing a well-feathered specimen of the Hemlock Spruce, said to have been planted by Loudon, the eminent landscape gardener, having a stem girthing 5 feet 8 inches at 4 feet up, and dividing into two stems at 8 feet, with a total height of 60 feet, and a spread of branches sweeping the ground, with a circumference of 174 feet; and a beautiful example of *Picea orientalis*, 74 feet in height, feathered to the ground, and from base to apex a perfect cone. Here is also one of the most interesting and notable trees in the whole collection at Strathfieldsaye, namely, one of the original, or first-introduced trees of *Sequoia* (*Wellingtonia*) *gigantea*, named after the great Duke of Wellington. It was planted where it stands by Her Grace the Duchess of Wellington on April 24, 1857. It is a handsome tree, in vigorous health, a perfect model of a *Sequoia* (*Wellingtonia*) richly clothed with branches from the greenward to the apex, and appearing to be quite at home amidst its environment. Measured in 1868, it had attained a height of 24 feet 6 inches, with a spread of branches 44 feet in circumference; and a stem girthing 6 feet at 6 inches from the ground, and 4 feet 10 inches at 2 feet up. On January 12, 1872, it measured 30 feet in height, 8 feet 7 inches in girth at the base of the stem, and 5 feet 4 inches at 4 feet from the ground, with a spread of branches 54 feet in circumference. It was measured in September, 1895, and found to be 71 feet 4 inches in height, 21 feet 6 inches in girth of stem at the base, and 16 feet 5½ inches at 4 feet up, with a spread of branches 110 feet in circumference. These dimensions compare favourably with the largest specimens of *Sequoia gigantea* in Great Britain, and the tree is among the finest of its kind to be found anywhere outside its native habitat in the mountain ranges of California. A cutting from this fine tree was struck, and when about 2 feet high it was planted out by the Princess of Wales in 1875. This has now attained a height of 30 feet, and a girth of stem of 6 feet at 4 feet from the ground, and has the handsome shape and characteristic appearance of the parent-tree.

At a short distance from the large *Wellingtonia* stand two handsome trees of the yellow-flowered Chestnut (*Pavia*), worked on the common Horse-Chestnut. They are very healthy, and highly ornamental, flowering profusely every year. A large specimen of *Pinus Cembra* was not in a thriving state, having suffered severely from the hard frosts in 1894

and 1895. A vigorous young tree of *Abies nobilis* was, on the other hand, a picture of health, and the silvery sheen of its foliage stood out in pleasing contrast with that of its more sombre congeners. A beautiful specimen, perfect in outline, of *Abies Nordmanniana* has attained to a height of 67 feet 6 inches, and is a very effective Conifer. Adjacent to this handsome Conifer is a fine example of the Holm, or Evergreen Oak, *Quercus Ilex*, bearing acorns freely, with a stem girthing 10 feet 6½ inches at 4 feet up, and rising to a height of 66 feet. A beautifully-variegated variety of the common Oak stands near at hand, with a stem-girth of 5 feet 6 inches at 4 feet up—an extra fine specimen of its kind, and bearing a fine crop of acorns among its richly-coloured foliage. A few yards outside the grounds at this point, standing in the park is a magnificent English Oak, *Quercus pedunculata*, with a solid bole girthing 22 feet 8 inches at 4 feet up. At the ground level, measured round the spurs, it girths 39 feet, and is a monarch of its kind, although there are many other majestic Oaks in the park closely approaching it in size.

Returning to the grounds, a splendid example of the Copper Beech is worthy of note, as being one of the most effective of ornamental trees when seen, as here, in its best form. A fine tree of *Taxodium* (*Sequoia*) *sempervirens* is 70 feet in height, and has a stem-girth of 12 feet at 4 feet up. The severe winter of 1894-95 has left its mark on the foliage and young growth, but the tree is fast recovering itself, and in another season the effects of the frost will be quite obliterated. A striking specimen of *Pinus Benthamiana* attracts attention from its robust habit and vigorous appearance, and has attained to a height of 69 feet 6 inches. Many other fine specimens of Conifers and broad-leaved trees are seen thriving well in the pinetum, and their number is being constantly added to by the introduction of the choicest species and varieties of ornamental trees and shrubs, among the more recent being some of the more select varieties of Conifers, Maples, Oaks, Elms, Beech, Birch, Thorn, and Pyrus. A notable feature also in the pinetum is the huge mass of *Rhododendrons* with which it is adorned. When in flower they must add greatly to the charms of this most attractive spot.

Passing from the pinetum towards the mansion, many fine ornamental trees embellish the grounds. One of the first to attract special attention was a grand example of *Ailanthus glandulosa*, standing in a fine open situation, with its leafy branches drooping all round to the surface of the lawn—an ideal tree to sit under on a hot summer's day. It girths 6 feet 2 inches in the stem at 4 feet up; and the spreading branches have a circumference of 165 feet. Standing amongst some grand clumps of Hollies, Yews, *Rhododendrons*, and other shrubs, are three curiously-gnarled Scots Firs, which lend quite an air of antiquity to the spot. Hard by grows a fine example of the Himalayan Pine, *Pinus excelsa*, its silvery foliage and soft outlines forming a marked contrast with the rugged Scots veterans. Close by stands a fine tree of the Sweet Gum, *Liquidambar styraciflua*, which is at all times a beautiful tree, but in the autumn, when it assumes its richest tints of foliage, it is a perfect gem amongst trees.

Near to what is known as the "Rook Clump," there stands a picturesque specimen of the White Birch, *Betula alba*, a rare old tree, spreading its boughs far out into shapes of grace and beauty. One of the finest forms of the cut-leaved Beech, *Fagus sylvatica aspleniifolia*, is seen flourishing

vigorously here, and is probably one of the largest specimens of its kind in the country. It girths 6 feet 6 inches at 4 feet up; and when viewed from a little distance the tree, with its delicately-out leafage, may readily be compared to a huge Maidenhair Fern. Its near neighbour is a handsome specimen of the cut-leaved Lime, both trees standing well out, and showing to great advantage in their environment. The "Rook Clump" consists chiefly of fine old Beeches, with tall clean stems and umbrageous tops, in which a colony of rooks abide. Some rugged specimens of *Pinus Pinaster* and a tall Larch with a bare stem and long drooping branches also attract notice in the clump; and on its outskirts are seen two grand specimens of the Tulip-tree, *Liriodendron tulipifera*. D.

(To be continued.)

## NEW OR NOTEWORTHY PLANTS.

### ASPLENIUM (DARÆA) PERKINSI, *Jenm., n. sp.*

Rootstock fibrous, densely clothed with finely attenuated, undulated, reticulated, castaneous scales; stipes tufted, several, channelled, glossy castaneous, 1 to 2 in. long; fronds bipinnate, oblong-lanceolate, ¾ to 1½ foot long, 2 to 4 in. wide, much reduced at the base, tapering at the apex into a filiferous naked thread 2 to 3 in. long, radiant at the end, firmly membranous, naked, pellucid, dark glossy green; rachis and costa similar to the stipes; pinnae numerous, spreading horizontally, sessile, obtuse, pinnate, 1 to 2 in. long, ¼ to ½ in. wide, alternate, with their own width or more between them; segments lax, broadly cuneate, sessile, bi or tri-lobed but not divided beyond the third or middle, 1½ to 2 lines long and wide; lobes roundly-pointed, ¾ line wide; veins simple in the lobes, not reaching the point, each bearing, medially, a single short, tumid sorus; involucre vaulted at length.

In damp forests, in the region of the Kaisteur Falls, Potaro River, British Guiana; named after Mr. H. I. Perkins, Acting Gold Commissioner of the Colony, who lately discovered it, in quantity. A slender species, tufted at the top of the fronds, very close to *A. rutaceum*, Mett., but differing by its much laxer habit, abrupt, instead of gradual, reduction of the pinnae toward the base of the fronds, and the slender, indurate, but fragile, castaneous vascular parts. *A. rutaceum*, Mett. (*Aspidium*, Willd.) was founded on *Plam. Fil. t. 57*, which differs from the plants since ascribed to it in having a truncate base, and the apex terminating in an ordinary segment, instead of having a gradually tapering base and leafless radiant tail-like extension of the rachis at the apex, which the latter show. In the pinnules, however, the chief character to go by, the plants referred to it quite correspond. Hooker's figure, plate 34, shows this character exactly, which consists in the pinnules being merely lobed at the top, but not divided into free segments. This reveals the fact that the Jamaica plant hitherto referred to *A. rutaceum*, is quite another species—the final segments being free and entire. This latter species I have described in my *Synopsis of the Jamaica Ferns* in the *Bulletin of the Botanical Department, Jamaica*, and I now propose to call it *A. Willdenovii*, Jenm. G. S. Jenman, Demerara.

### VIGNA STROBILIFERA.

This is a very recent acquisition, of which neither the novelty nor the ornamental qualities can be contested. It is a Leguminous liane, perennial, discovered in Mexico in 1893 by the traveller Pringle, and named by Professor Sargent, who sent me some seeds of it. Sown in 1894 at the foot of a wall in a favourable south aspect, the tubers passed the winter undisturbed, and flowered freely this year during October and part of November. From the strong tubers in spring, issued numerous twining stems several yards long, of which the trifoliate leaves a little resembled those of Beans. This

Price 3d.; Post-free, United Kingdom, 3½d.; Twelve Months, 15s.; Foreign, 17s. 6d.

P.T.O.

shoot of the second year's growth grow rapidly, and from the end of the summer there were seen forming in the axils of the leaves cone-shaped or strobile-like inflorescences, the length and breadth of a finger, formed of large imbricated bracts which covered the growing flowers. In the progress of their growth these strobile-like heads developed into large bunches of papilionaceous flowers a little smaller than those of a *Pee*, rosy white as to the standard, and the carina and wings of a beautiful purple colour. This blooming is remarkable, and it is not

of blossom, freedom to produce it, and the ease with which the plants can be grown. The varieties commonly met with in gardens are *E. Russellianum*, *E. R. tricolor*, *E. R. violaceum*, and *E. R. superbum*. Grown from cuttings struck in the months of February and March onwards, these plants form capital materials for furnishing hanging-baskets,  *jardinières* small vases for use on the dinner-table, or pots, to add a little colour to the sombre tints of the intermediate-house and conservatory during the winter. And the period during which a good stock

of *phylam truncatum*, grown both as pyramids and standards, and find them very useful and beautiful subjects for the decoration of the conservatory during the months of November and December." A few new varieties of *Epiphyllum* have appeared in recent years, notably *E. t. Makoyanum* and *E. t. Gaertneri*. The latter differs from most of the older forms, and from *E. t. Makoyanum*, by the greater breadth of its fleshy-jointed branches, and its larger and more brilliant-coloured flowers, which are of a cinnabar-red. *E. Makoyanum* has the terminal joints fringed with stiff hairs; its petals are shorter, and the colour a lighter scarlet.

FIG. 1.—EPIPHYLLUM TRUNCATUM AT ORWELL PARK.

without due reason that the introducer of this plant compares it to that of the *Wistaria*, so well-known in our gardens. It should rank among the most decorative plants which we have yet received from Mexico, and will be a treasure for greenhouses in the north, and for gardens in the warm parts of the south of Europe, where it would cover trellises or arbours. *Ch. Naudin, Revue Horticole*, p. 585, December 16.

EPIPHYLLUM TRUNCATUM.

AMONGST the gay *Cactus* tribe of plants which can be had in bloom early or late in the year, we have none to rival the varieties of *Epiphyllum truncatum* for brilliant coloring, and varied beauty

of plants will furnish flowers is of considerable length, seeing that gentle forcing will bring early matured plants into bloom at the end of the autumn, and a succession may easily be kept up till the spring. It is usual to graft the *Epiphyllum* on a stout-growing *Cereus*, or on *Pereekia aculeata* (*Barbados Gooseberry*), *Cereus grandiflorus* (the night-flowering), *C. multangularis*, and others similar, which make excellent stocks for them. The plant which we illustrate (fig. 1), was grown by Mr. Wallis, the gardener at Orwell Park, Ipswich, who says the "dimensions of the largest plant is 6 feet 6 inches high, and 3 feet 6 inches through, and the other same height, but not quite so far through. The photos were taken on November 18 by an amateur friend. Altogether we have several large plants of *Epi-*

NOVELTIES OF 1895.

THE history of horticulture can show probably no instance of success attending the gardener's art in regard to floriculture so marked as that of the last few years. In the rapidly-growing field of Orchid hybridising. Those who beheld with more curiosity than admiration the few earliest productions, never imagined the wealth of beauty which would be created in that direction by the year 1895; and it is only reasonable to infer that even those of us who are more enlightened on the subject of cross-breeding than our predecessors, have yet many startling revelations to witness when the minute progeny of the unending combinations of species and varieties present and prospective arrive at maturity and bear blossoms. First in this field, it is but natural that Messrs. J. Veitch & Sons, of King's Road, Chelsea, should keep in the van of the band of Orchid hybridists, and their novelties of 1895 have been well worthy of their reputation. Two fine new hybrid *Phalaenopsis*, *P. x Ariadne* (*Stuartiana* ♂, *Aphrodite* ♀), and *P. x Luddeviolecea* (*Luddemanniana* ♂, *violacea* ♀), deserve special mention, for seedling *Phalaenopsis* are extremely difficult to rear. Late in the year Messrs. Veitch brought out *Laelio-Cattleya x Lady Rothschild* (*C. Warscewiczii* ♂, *L. Perrinii* ♀), one of the most charming novelties of the season; and *Calanthe x Harrisii*, the finest pure white *Calanthe* of the *Veitchii* class; and previously they had raised a very singular hybrid of the *C. veratrifolia* section, *C. x manco-tricarinata*, with pretty flesh-coloured flowers. From the favourite *Cattleyae*, Messrs. Veitch have evolved *C. x Macraea* (*superba* ♂, *Warscewiczii* ♀), *C. x Eros* (*Walkeriana* ♂, *Mossii* ♀) which received a First-class Certificate at the Royal Horticultural Society on August 13, and several varieties of the robust and bright-coloured *C. x Mantinii* (*Dowiana* ♂, *Bowringiana* ♀), which first appeared with M. G. Mantin of Paris. Of the hybrids between *Laelia* and *Cattleys*, they have *Laelio-Cattleya x Myra* (*L. flava* ♂, *C. Trianaei* ♀), a charming, soft primrose flower; *L. C. x Eunomia* (*C. Gaskelliana* ♂, *L. pumila Dayana* ♀), *L. C. x Semiramis* (*C. Gaskelliana* x *L. Perrinii*), *L. C. x Isis* (*C. x Marsteronensis* ♂, *L. pumila* ♀), and *L. C. x Euphrosyne* (*C. Warscewiczii* ♂, *L. pumila Dayana* ♀), all distinct, showy, and of compact growth. Of hybrid *Dendrobium*, Messrs. Veitch's best hit was the extraordinary *D. x illustre* (*Dal-housieanum* ♂, *chrysotoxum* ♀); and of *Cyprripedium*, *C. x Norma* (*Niobe* ♂, *Spicerianum* ♀), *C. x Metis* (*philippinense* ♂, *Boxallii* ♀), *C. x Minoea superba* (*Arthurianum* x *Spicerianum*), and *C. x Carnationum*, Veitch's var., which has lower sepals extraordinarily enlarged and divided. Messrs. Veitch also imported and first flowered the noble *Cirrhopetalum robustum*, Blume; the pretty *Coclogyne Veitchii*, and various other species.

Sir Trevor Lawrence, Bart., who cares alike for the species and for the hybrids, and who, while being our most successful amateur cultivator in bringing out new Orchids, by good cultivation evolves beauty previously unsuspected from selected varieties of well-known species. During the year, one of the most interesting of showy species flowered at Burford, viz., the orange-coloured *Luddemannia triloba*, and there also the first flower of the gigantic *Bulbophyllum grandiflorum*, Blume, first saw the light;

the known but extremely rare *Dendrobium Treacherianum* flowered as it never had been flowered before; the singular and handsome *Disa longicornu* bloomed for the first time; and many other events interesting to botanists took place; while the lovers of garden hybrids were met with the handsome *Cypripedium* × *platycolor* (C. *Stonoi* *platytenium* × C. *concolor*); C. × *Pelletianum*, "Barford Beauty," C. × *Eleanor* (*selligerum majus* × *superbiens*), *Masdevallia* × *Sauttryana*, and other handsome hybrids raised at Barford.

Baron Sir H. Schroder excels in fine varieties of Orchids of every class, and in the hands of his gardener, Mr. H. Ballantine, they put on their best form. At the Temple Show many new forms of *Ontoglossum* were exhibited, and throughout the year many good things from The Dell have been brought before the Orchid Committee of the Royal Horticultural Society. Among them we noted the fine natural hybrid *Phalenopsis* × *Yongiana*; the magnificent *Cattleya Mendeli Dellenis*, a noble specimen of the pretty *Dendrobium Hildebrandti*, and quite recently a charming white natural hybrid *Lælia* of the L. × *Finkeniana* type, *Lælia* × *Finkeniana Schroderi*.

From Lord Rothschild's gardens at Tring Park (gr., Mr. E. Hill), has been exhibited the new, wholly purple-lipped *Cattleya Warcewiczii* *Rothschildiana*; and from the rich collection of botanical Orchids formed by the Honble. Walter Rothschild, have been shown the ornate *Cirrhopetalum Rothschildianum*, the showiest of the plume-bearing section; the pretty and rare *C. gamosepalum*; and *Aërides cylindricum*, both of even greater interest than many hitherto unrecorded species; the showy *Lælia flava*, var. *aurantiaca*, and other pretty plants.

To Norman C. Cookson, Esq., Oakwood, Wylam-on-Tyne (gr. Mr. Wm. Murray), fell the honour to carry off the Royal Horticultural Society's prize for the best hybrid Orchid of the year with *Phalis* × *Cooksonia* (*Humboldtii* ♀, *grandifolia* ♂); and among other good things he has shown the fine white *Cattleya labiata Cooksonia*; *Dendrobium* × *Murrayi* (*nobile* ♀, *albo-sanguineum* ♂); and *D. Astrea* (*anreum* ♀, *crassinode* ♂), both good.

Among the numerous new Orchids shown by Messrs. F. Sander & Co., St. Alban, the best were of the species *Zygopetalum* (*Bollea*) *Schroderianum*, a fine white flower; *Angraecum Eclerianum*, previously known, but not introduced; *Batemannia peruviana*, *Lycaste Dyeriana*, a quaint species, with the habit of growth and arrangement of its greenish flowers of *Cattleya citrina*; *Celoglyne carinata*, C. *Micholitzii*, and C. *Balfouriana*, all good and distinct; the handsome white *Dendrobium Donnesia* (first flowered by Mr. Bradshaw, of Southgate), the new Bornean *D. speciosissimum*; several new spotted forms of *Ontoglossum crispum*, of which the fine yellow O. c. Sander's *Monarch* is the most distinct; the handsome *Anacochilus Sanderiana*, the pretty *Masdevallia Forgetiana* and M. *eclyptrata*, the showy *Trichopilia brevis*, *Microstylis macrochila*, and many other interesting plants, as well as having the unique good fortune to introduce for the first time in some number the noble white *Lælia*-like *Dendrobium Johnsonia*. The hybrids at this nursery were in 1895 both many in number as well as excellent in quality. Those especially noteworthy are *Cattleya* × *Fowleri* (*Leopoldi* × *Hardyana*), C. × *Miss Measures* (*Ludemanniana* ♀, *velutina* ♂), *Lælio-Cattleya* × C. G. *Roebling* (*purpurata* ♀, *Gaskelliana* ♂), *Lælio-Cattleya* × D. S. *Brown* (C. *Triarai* ♀, L. *Schilleriana* ♂), *Sobralia* × *Amesiana* (S. *xantholeuca* ♀, S. *Wilsoni* ♂); and among the *Cypripediums*, C. × *Marchioness of Salisbury* (C. *bellatulum* × C. *barbatum superbum*), C. × *Chas. Steinmetz* (C. *philippinense* var. *Rebeleni* × C. *Lawrenceanum*); C. × J. H. *Berry* (C. *Harrisianum superbum* × C. *concolor*); C. × *Madame G. Troffant* (C. *ciliolare* × C. *Stonoi*); C. × *Fordianum* (C. *Stonoi* × C. *callosum*); C. × *Spicero-niveum*; C. × *Clement Moore* (C. *Dauthieri* × C. *Leeanum*); C. × A. de *Lacresse* (C. *Curtisi* × C. *Rothschildia-*

*num*); C. × *Fowlerianum* (C. *Harrisianum superbum* × C. *bellatulum*); C. × *Fran Ida Brandt* (C. *Io grande* × C. *Yongianum*); C. × *Mrs. Fred. Hardy* (C. *superbiens* × C. *bellatulum*); C. × *Svend Branson* (C. *Lowii* × C. *Curtisi*); and C. × A. J. *Herrington* (C. *Leeanum* × C. *antheranthum superbum*).

Messrs. Charlesworth & Co., Ilston, Bradford, have the honour of being the importers of the spotless white *Cypripedium bellatulum album*, the clear yellow *Dendrobium velutinum*, D. *Hildebrandi*, D. *chryseoprepis*, *Cryptophoranthus obovifolius*, and *Lælia tenebrosa* var. *Charlesworthii*.

To Messrs. B. S. Williams & Son, Paradise and Victoria Nurseries, Holloway, N., the credit is due of introducing *Catasetum apendens areum*, *Zygopetalum* (*Pescatorea*) *Roezii rosea*, *Cypripedium* × G. H. *Rogers*, and others; and Messrs. W. L. *Lewis & Co.*, Southgate, N., with the fine-looking *Cypripedium* × *Ashton*, and some other novelties.

Messrs. Hugh Low & Co., Clapton, among other good plants introduced by them, showed *Dendrobium speciosissimum*, D. *sanguineum*, the clear yellow-coloured *Cypripedium insigne* var. *Laura Kimball*, the fine *Cattleya Mendeli grandis*, the white C. *labiata Lowii*, which has a velvety, rich purple-coloured blotch on the lip, nearly approaching C. L. *Cooksonia*; *Ontoglossum* × *Wilckeanum Lowii*, and *Cypripedium* × *Gertrude Hollington* (C. *ciliolare* × C. *bellatulum*), which was raised by A. J. *Hollington, Esq.*, of Enfield (gr., Mr. Ayling), who is likewise the raiser of C. × *A. Fred Hollington*, a very handsome hybrid out of C. *Curtisii*.

Among amateurs who have exhibited showy flowers during the year, Thomas Scatter, Esq., of Stand Hall, Whitefield, Manchester, is, as usual, to the fore, his forms of *Cattleya aurea* being extremely fine, especially C. a. *Johnsoniana* and C. a. *Marantina*; *Cypripedium* × *Lord Derby* is, so far as we know of, by far the finest of the section to which it belongs; and *Cattleya superba alba* is a superb variety. The same variety, it may be remarked, also flowered with *Eljah Ashworth, Esq.*, at Harefield Hall, Wiltshire, Cheshire; *Dendrobium* × *Cassiope Ashworthii*, and other new varieties, flowered in the same garden. Mr. Ashworth is also the possessor of the only specimen of the pure white *Dendrobium Phalenopsis hololeuca*. W. Thompson, Esq., of Walton Grange, Stone, exhibited *Ontoglossum crispum* "The Bride;" *Cattleya labiata corulea*, and C. L. *Thompson's* var., two fine varieties; and the uncommonly handsome form of this valuable winter-flowering species, named C. *labiata Broomeana* came from Joseph Broome, Esq., at Llundudno, whose collection of Orchids is famed for the showy *Cattleyas* that it contains.

The novelties exhibited by D. B. *Crawshaw, Esq.*, of Rosefield, Sevenoaks (gr., Mr. Cooke), consisted of *Lælia anceps Crawshawana*, L. a. *Rosefield* var.; *Ontoglossum triumphans*, var. *Lionel Crawshaw*; O. *Uro-Skinneri*, *Crawshaw's* var., and *Cattleya Mendeli Princess of Wales*, all of much excellence in their respective classes.

Of fine novelties shown by Sir Frederick Wigan, of Clare Lawn, East Sheen (gr., Mr. W. H. Young), were *Cypripedium bellatulum album*, *Lælia grandis*, Wigan's var.; L. *purpurata*, *Richmond Gem*, and *Cattleya Moesia*, *Lady Wigan*, a white form, which found many admirers on the occasion of its being shown at the Temple Show.

Some of the prettiest hybrid Orchids of the season in their respective classes were exhibited by C. L. N. *Ingram, Esq.*, Elstead House, Godalming (gr., Mr. T. W. Bond). Noteworthy were *Cattleya* × *Lady Ingram* (C. *Eldorado* × C. *Dowiana aurea*), a pretty and fragrant flower, *Lælio-Cattleya* × *Obello* (C. *maxima* × L. *elegans Turneri*), a showy rose and crimson hybrid; C. × *Cecilia* (C. *Lawrenceana* × C. *Triarai*); and *Lælio-Cattleya* × *Chas. Darwin*, besides a variety the result of L. C. *elegans* cross.

#### CONTINENTAL EXHIBITS.

Some of the finest were the grand forms of *Catasetum* from Messrs. *Linden, l'Horticulture Internationale*, Brussels, and which are likely to give an impetus to the cultivation of this extra-

ordinary, but rather neglected genus. The finest of those shown was undoubtedly *Catasetum imperiale*, which was awarded a First-class Certificate at the Royal Horticultural Society. Those who saw these *Catasetums* at the time, were struck with the peculiar beauty of C. *Lindeni*, C. *mirabile*, and others. Some few fine hybrids came from the collections of M. *Jules Hye-Lyssen*, M. A. *Peeters*, and others, in sufficient quantity to show that the year was fairly productive on the continent as in our own country.

Orchid novelties or re-introductions figured in the *Gardeners' Chronicle* during the past year:—

- Aërides cylindricum*, Lindl., March 30, p. 393.
- Batemannia peruviana*, May 4, p. 551.
- Bollea Schroderiana*, April 20, p. 497.
- Bulbophyllum grandiflorum*, Blume, April 6, p. 429.
- Catasetum imperiale*, C. *mirabile*, and C. *Lindeni*, March 16, p. 329.
- C. *tabulare* var. *rhizophorum*, July 13, p. 43.
- Cirrhopetalum Rothschildianum*, Nov. 23, p. 609.
- Cirrhopetalum robustum*, June 22, p. 771.
- Cypripedium* × *Lord Derby*, Sept. 23, p. 357.
- Cypripedium Kimballianum*, June 29, p. 801.
- Cypripedium* × *Gertrude Hollington*, May 25, p. 644.
- Cypripedium* × *Madame Jules Hye*, Jan. 26, p. 117.
- Cypripedium* × *Mrs. Fred Hardy*, Jan. 26, p. 111.
- Cypripedium* × *Olenus*, May 18, p. 613.
- Dendrobium Hildebrandi*, July 27, p. 93.
- Dendrobium* × *illustre*, July 6, p. 15.
- Dendrobium Phalenopsis hololeuca*, October 5, p. 397.
- Disa* × *Kewensis*, September 7, p. 273.
- Disa longicornu*, June 29, p. 791.
- Houlletia tigris*, November 9, p. 519.
- Lælio-Cattleya* × *Fowleri*, August 31, p. 245.
- Lælio-Cattleya* × *Clonia superba*, October 12, p. 421.
- Ludemannia triloba*, December 14, p. 713.
- Masdevallia melanoxantha*, March 23, p. 359.
- Microstylis macrochila*, September 21, p. 325.
- Ontoglossum triumphans Lionel Crawshaw*, April 20, p. 489.
- Ontoglossum Pescatorei leucoxantha*, May 25, p. 681.
- Polycycnis Lehmanni*, August 31, p. 245.
- Trichopilia brevis*, November 30, p. 641.

(To be continued.)

## ORCHID NOTES AND GLEANINGS.

### CYMBIDIUM TRACEYANUM.

This fine plant was illustrated in the *Gardeners' Chronicle* in 1891, p. 137, from the specimen in Baron Schroder's collection, and this plant was, for a time, the only one known to exist. Its supposed parentage was C. *grandiflorum* (*Hookerianum*) × C. *giganteum*, and much curiosity has been displayed as to the correctness of this supposition, and also as regards the native locality of the plant. Of late several specimens have come for naming, chiefly from the north, and one correspondent, writing from Philiphaugh, Selkirk, who sent a flower of C. *giganteum* and another of C. *Traceyanum*, gives the following interesting particulars:—"Both these *Cymbidiums* are from one importation, and were received from a friend of Mr. Steel, in Barnah. They were very small plants when we got them, and they now will fill 9-inch pots, and are flowering for the first time, carrying two fine spikes of seventeen and eighteen flowers respectively."

These isolated plants, received by different persons, seem to indicate that C. *Traceyanum* is not found in quantity. It probably only grows in small areas, and where C. *grandiflorum* and C. *giganteum* mingle or approach each other. J. O'B.

### SOBRONITIS GRANDIFLORA.

This is a grand Orchid when under good cultivation. In one of the cool houses of Mr. Sidebottom, Erisdene, Bowdon, there were recently about a score of plants, each bearing from twelve to twenty flowers of large size, and of that beautiful vermilion colour which is so captivating in any flower, and

especially so in an Orchid. These plants are grown in shallow pans, suspended from the roof, and rather freely potted; indeed, this dwarf-growing Orchid does not relish hard-and-fast block treatment. I used to grow it to a largish size, treated liberally as to pot-room. This treatment is adopted in Mr. Sidebottom's house, and it answers admirably. Suspended in juxtaposition to a fine lot of *Cypripedium insigne*, densely flowered, and with large-sized slippers, too, the plants at once took the eye. The lesson taught is not to starve the plants, and keep them moderately cool. *J. A.*

### WANTED, A NATIONAL HORTICULTURAL SOCIETY.

In several of your contemporaries, as also in your own columns, the desire for a National Society of Horticulture has recently been expressed; in a word, it now seems desirable that the Royal Horticultural Society should really become the Royal Horticultural Society of Great Britain, even if not of Ireland as well. Some years ago the Society did attempt the holding of provincial shows, but with the solitary exception of that held at Bury St. Edmunds, I believe, they were financial disasters. Although it is no use fighting against the results apparent, and the experience then obtained, still, there may be other fields rich enough to repay cultivation. With some little organisation and application it might be possible to affiliate all the best local and provincial societies with the Royal Horticultural Society, and in populous centres, such as Liverpool, Manchester, Birmingham, Edinburgh, &c., the Royal Horticultural Society might appoint local assistant-secretaries, or even special committees, to act in the interest of the Society, and in the cause of horticultural progress generally. As it is, the Royal Horticultural Society is chiefly a metropolitan society, or rather one of many metropolitan societies, a fact that is to be deplored, seeing that there might be an enormous saving of working expenses if the work of several, even if not all of these societies could be centralised. "Competition" may be "good for trade," but there is a heavy loss entailed all the same.

If it should be found impracticable to appoint local sub-secretaries, or local committees, possibly delegates could be appointed from amongst existing Fellows of the Royal Horticultural Society to visit the great provincial exhibitions, with power to make any special awards of medals or certificates to really deserving objects of culture or production, in harmonious accord with local judgment, of course, whenever possible. Of course, I know that the whole question involved is a complex one, and that many practical difficulties will have to be faced and overcome; still it is thought both by myself and others in the craft, that no time should be lost in endeavouring at all events to lift the Royal Horticultural Society from the "metropolitan trade route" it at present pursues, into a free and open "overland route."

No one condemns the trade, of course, for the great and generous aid they have constantly given to our Society, even although such aid may in a few cases be merely given as *quid pro quo*; nor, on the other hand, can anyone honestly and wisely blame the Society for turning such assistance as the trade has proffered, or given from time to time, to the best financial advantage. At the same time there is a higher and wider point of view, and it has long been felt that our Society should strive to occupy a more honourable and broader position, not one of merely metropolitan interest, great as that may be, nor of trade interests, important as they also may be to a limited section of the Fellows; but that much more than all this could and should be done.

The main point is, how to reduce all the best suggestions that are being periodically made to practice? It seems quite clear that provincial horticulturists take but a slight interest in the Society; hence it follows that the Society must go out to them in some form or other—to be

decided on by its executive, of course. The delegate plan seems to be at once feasible, practical, and comparatively inexpensive to boot. There is plenty of local capital and intelligence to work really excellent exhibitions, on which the Royal Horticultural Society might set its hall-mark, and bestow some of its prestige with good results all round. Both the Society and its publication, that is to say, the *Journal*, would gain by this plan being adopted; or, again, would it not be possible and practical to invite all the Fellows of the Society, and other distinguished amateurs and professional gardeners who are not Fellows, to send photographs, and to report from time to time any interesting facts as to the flowering or fruiting of any rare trees, shrubs, or plants, or of special crops grown in their neighbourhood, such information to be edited and condensed if necessary for the society's *Journal*. In this way a vast amount of valuable information from all parts of the country could be easily and cheaply obtained. Of course, the Frost and Fog reports are not forgotten; but my idea is to have a permanent running report of contemporary horticulture from all parts of the country.

There is another point affecting the awards of the Royal Horticultural Society; they are, no doubt, carefully and honourably made in most cases, but they are confined within bounds that are nowadays far too narrow, and in this way the interest of our craft generally suffers, and with that also our interest in the society itself.

Fruits, vegetables, flowers, trees, shrubs, and other new plants (especially Orchids) are honoured with certificates and medals, but how rarely is the real art and science of gardening honoured or commended in any way. To name a case in point: there is now being published one of the great practical works of our era, a work that ought to be the textbook for gardeners for the next ten years. I allude to Oliver's translation of Karner's great *Pflanzenleben* a book containing the laws and principles of plant growth that lie at the bottom of all successful plant cultivation in garden, forest, or farm. I saw a meagre review of this great book in the last number of the *Journal* of the Royal Horticultural Society, but it would have redounded more to the credit and acumen of the Council if they had awarded a Gold Medal or the highest award in their power to such a book. This is merely one example amongst many that may be cited as an example, for I hope to see the day when nothing that is great or even serviceable and practical in connection with garden craft whether book or picture, or tool or implement, or machinery—anything, in fact, that aids real progress—shall be at once examined and honoured according to its merits by our society. Above everything else, however, it is necessary for us to know the policy of the society that takes our subscriptions, and gives many of us nothing but the *Journal* in return. We hear of proposed changes in the management of the gardens at Chiswick. What is the character of the proposed innovations? These are questions above all mere personal considerations, and a reply ought, in all honesty and fair dealing, to be forthcoming.

In any case, the fact is generally acknowledged that our society is too restricted, and too limited in its scope; it is only one of three or four important metropolitan bodies in the same line, and it leaves all the good work, all the progress and high endeavour of the country at large unseen, unrecorded, and unrewarded. When we compare the Royal Horticultural Society with the Royal Agricultural Society of England, whether it be as to its widely-extended practical work and methods, or its valuable publications, we must of necessity feel somewhat disheartened, even if not ashamed. The one graceful and pleasant action of the Royal Horticultural Society of late was the giving of a Life Fellowship to their late Superintendent at Chiswick (Mr. A. F. Barron), and it is to be hoped that future Councils will not deprive him of his right to vote at its meetings, as was, I believe, once before the case after Mr. D. T. Fish was honoured in a similar manner some years ago.

The above are my own convictions, set down in no petty carping spirit, for I have, and long have had, a special interest in the Royal Horticultural Society, and would willingly aid in bringing about a good understanding between the great body of its Fellows and the Executive, a state of things that is non-existent at the present time, and will continue until the Fellows are told honestly and frankly what is really and truly the policy of the society. *F. W. Burbidge.*

## FLORISTS' FLOWERS.

### THE TULIP.

I REMEMBER an old Tulip fancier saying, "I attribute the almost universal failure in Tulips last season to the weather alone, and by judicious protection I believe a repetition of the loss and disappointment will be avoided." What was meant is protection in January, from excessive wet, snow, and severe frost. I tried for years to grow the Tulip without any protection, and should have succeeded but for severe weather during the early months of the year. The tender leaves would sometimes push through the soil in January, and rain or melted snow would afterwards collect in them, and the result was not satisfactory. To avoid this, the old and simple arrangement of iron hoops bent over the beds and fixed in position by rods tied to them horizontally is the best one. Mats are then thrown over the beds when the weather is likely to be injurious. These mats throw off superfluous wet, in addition to providing protection from snow and frost. In addition, I give a good mulch soon after Christmas with decayed stable-manure or spent Mushroom bed soil. This applies to all the late-flowering Tulips, including those called 'Darwin Tulips.'

### PANSIES.

If Pansies be grown and flowered in 6-inch pots in rich soil, and the pots are placed close to the glass, they produce some large, well-maked flowers, long before they may be obtained out-of-doors. Place the frames in a sheltered position, and where they will get all the sun possible. Watch for slugs at night, and use care in regard to watering, allowing no plant to become very dry at the root. Pansies in beds are best left to take care of themselves, but see that they are firmly fixed in the ground, so that high winds cannot disturb their position in the soil. Give a mulching of well-decayed manure over the surface of the beds; it will act beneficially in many ways.

### CHRYSANTEMUM.

The work of taking cuttings of these should be pursued at every possible opportunity. Each cutting should be planted separately in thumb-pots, and put under a hand-light in the cool Orchid-house, or other house with a similar temperature. The hand-glass should be kept close until the cuttings have made roots. Each plant should be removed from the glass as soon as it has commenced to grow. The cuttings intended to produce specimen plants of large size, require to be treated in the same way. All of the vigorous-growing sorts do best from cuttings, but those of medium vigour succeed better when the plants are obtained from old stools. If the plants are intended for exhibition, it is essential that they be grown "with a single stem seen distinctly above the soil in the pot;" and even if they are not for exhibition purposes, it is best to select a plant which was grown last season, to produce only three or four large blooms. Many of such plants have from three to nine growths pushing out from the stem some 3 to 6 inches above the surface-soil in the pot. The stem should be cut through above these growths, and the plant dug out of the pot, the soil being removed from the roots so as to allow of them being put into a 6 inch flower-pot. Place the plants near the roof-glass in any house from which frost is merely excluded, and they will continue to grow all through the winter. As the days lengthen, admit air more freely, and re-pot into 8-inch pots as soon as the plants need a shift; afterwards they may be put in 11-inch pots. Pompons should all be grown from cuttings. *J. Douglas.*

## LATE-BLOOMING SINGLE-FLOWERED CHRYSANTHEMOMS.

Two varieties of the single-flowered Chrysanthemum have outlasted all I have this season grown in a cold house, viz., Admiral Sir T. Symonds, a large, broad-petalled variety, with stout florets, bright in colour; and Jane, or Snowflake, also large, pure white, with long twisted florets, and very free and nice for cutting. I find the single varieties more lasting in damp, cold weather than the double varieties. Sir T. Symonds is particularly lasting; and if generally so late as it is with me, then it is an especially useful variety. R. D.

## FRUIT CORDONS.

MANY owners of small gardens are enabled to cultivate Apples and Pears as cordons and have considerable variety, who could not spare the space needed by large bushes and trees. I would not advocate for the cordon system any variety that can be grown at a profit, but only such as have fine quality, my remarks having application only to owners of small gardens, not to growers for market. Some persons may object to this division, considering that both should be studied, and fruit grown on cordons in the trade orchard. In my earlier years, I had a fair experience of fruit culture on a large scale, and I know that most amateurs do not want large quantities of any variety of fruit, but a long succession, combined with general good quality; whereas market fruit is mostly judged by its size and fine appearance. The Pear grown as a cordon gives a good return, providing proper attention be paid to stopping the shoots, manuring, root-pruning, and the and is good. A great deal, however, always depends upon the aspect afforded the cordons, and the varieties planted. For instance, last year and the previous year excellent fruits of many varieties were obtained from trees having a northern aspect; and I may mention instances of fruits of Pitmanston Duchesse nearly 16 oz. in weight, and fine Doyenné Boussoch and Beurré Clairgeau from cordons. These varieties, I admit, are but of second-rate quality; still, they are good market fruits, and it shows what may be done in favourable seasons on northern aspects. In cold districts, and gardens much exposed, or with but little shelter, and on soils which are cold and heavy, cordon Pears on a west aspect will afford fine fruits. At Syon there are many varieties of the Pear on walls with east aspect. There is a want of hard wood and fruiting-spurs on trees that are shaded by tall trees standing at some distance from them, and there is much wood made, and growth is late—hence, ill-ripened. In selecting varieties, only trustworthy fruiters should be chosen for particular aspects, all varieties not doing well on the same aspect are not suitable; some, indeed, are not deserving of a place on walls, but do well enough as bushes or pyramids, and some are excessively vigorous, and therefore not fit for cordons, bushes, or pyramids. A few years' trial of any particular variety is not enough, as so much depends upon soil, atmospheric influences, and the stock upon which a variety is worked, all of which have an effect on the growth of the tree; and I may here say that the land at Syon is not by any means good for fruit culture, and the results obtained there as those commonly reaped in many other places. I am not therefore inclined to find fault solely with the variety. A few which have done well at Syon in poor, gravelly soil, and with not over-abundant sunshine, will be noted below.

Adverting to the question of stocks, the Quince is the best for bushes and cordons if plenty of root-feeding is practised, the roots being mostly near the surface. To lack of food near the surface, the failure to fruit the Pear on the Quince may be frequently traced. I mulch the soil over the roots of these trees in the autumn and spring, and lift the bushes and cordons once in three or four years. By regularly acting thus much pruning is saved, and the trees kept fruitful. Some varieties will only do well on the wildling Pear stock, but the Quince is the best

stock when the soil is shallow, overlying gravel. Souvenir du Congrès on the Pear stock, and Clapp's Favourite, are varieties that crop on the Pear stock, and also bear excellently; Van Mons, Léon le Clerc is a sure fruiter on the Pear as cordon-trained trees. The following varieties do well at Syon, proving good croppers; some being grown for the production of fruits of extra-large size, others for keeping, and others for their superior qualities:—Triomphe de Vienne, Beurré Hardy, Beurré Fonqueray, and Beurré Alexandra Lucas, the last two new varieties being well worth space in all collections, but I have only grown them as cordons so far. Beurré Mortille, another of the less known newer kinds, is a valuable addition, a fine fruit, sweet and handsome; the same remarks apply to Marguerite Marillat, a continental variety, a large, showy fruit of excellent quality, and very free on a warm wall; all these newer kinds require warmth to get colour and flavour. Beurré Diel, Beurré Ballet père, Beurré Superfin do well as cordons; Beurré Bachelier never fails, but it is not a good Pear, though very free; Beurré Sterckman, grown cordon shape, is grand; and Emile d'Hayet is especially good and very free; Louise Bonne of Jersey comes very fine, and is delicious, being one of the best and most reliable cordons; Marie Louise, also Marie Louise d'Ucle, grows well, the last is named for size of fruit, the first where quality is desired. The valuable Doyenné du Comice does well—in fact, is much better in cordon form when grown on west or east walls. Nouvelle Fulvie on the Quince stock is a grand fruit, not the best-looking fruit, but delicious, and its late keeping is worth extended culture; Marie Benoist, a large, late variety, is reliable, and of good quality; the newer Princess makes a good cordon, and is very handsome; Olivier de Serres, a small fruit, is worth a place, being very prolific and a long keeper, but its fruits should be gathered late and at intervals when ready; it is also sweet and of good quality. Easter Beurré is another late-keeping variety, which is remarkable for heavy cropping and superior quality. There are several more equally good, but the record in my note-book shows that the above-named after several seasons' trial are valuable as cordons; and when it is considered how long a succession of fine fruit is obtained, the ease with which the trees can be protected from injury by frost and the birds, the list stands in no need of additions.

## APPLES, CHERRIES, AND PLUMS.

This section of the subject demands but little space, as they are less commonly grown (in the south, at least) in cordon form. Some varieties do not bear freely unless well exposed, and the branches stand a fair distance above the soil; but when a wall can be devoted to them, there is then no fear of having poor crops of fruit. The cordon Apple is grown mostly low, so as to form a kind of fence or finish to a vegetable or bush quarter, and in this position the cordon does not get enough sun. I would, however, advise the growing of Apple cordons on a fence, trained either upright or slightly sloping, when they will fruit grandly, and if there is space for extension, so much the better. Very fine fruits of the Apple can be obtained in this manner. These remarks apply to culinary kinds, such as Manx Codlin, Lord Grosvenor and Lord Derby; Lane's Prince Albert, Cellini, Grenadier, and Bismarck; and among dessert kinds, to Worcester Pearmain, Baumann, Red Reinette, Fearn's and Kerry Pippins, Irish Peach, Reinette du Canada, Melon Apple; the Russets in variety, notably, Rosemary and Boeton. We have got excellent results from cordons, which have been allowed more freedom than usual for a season or two, but this spoils the shape of the cordons, and when persisted in, the tree can scarcely be termed a cordon. If the top-growth is greatly restricted, it is not well to plant either shy-fruited varieties, or those that make strong growth; unless space of wall or other support can be given, the cordon-stem leader is allowed to grow on for a time. Several of the Ducks and Bigarrean section of the Cherry do splendidly as cordons, the growths soon getting thickly studded with fruiting-spurs. The

Plum does not give so good a return, as it requires more freedom of growth, and fruit comes mostly and better on the young shoots. Dener's Victoria is a Plum that does well when used as an edging to garden-walks, having a nice effect. Gooseberries as single cordons are quite successful, fruiting heavily every year. G. Wythes.

## BRANCHING PSEUDO-BULBS.

THESE are so rare among Orchids, that we give an illustration (fig. 3, p. 13) from a photograph of a *Laelia* kindly supplied by a correspondent, and which is the counterpart of one of *Odontoglossum Andersonianum* brought under our notice by Mr. Dr. Bary Crawshaw, see *Gard. Chron.*, June 15, 1895, p. 739.

## PARIS.

In Mr. H. L. de Vilmorin's private garden at Verrières are some specimen Conifers worthy of note, such as *Abies Lowiana*, a fine tree, here grown under the name of *A. grandis*; *Abies concolor*, a very beautiful specimen; *Abies Pineapo*, a characteristic tree, the curious hybrid between *A. Pineapo* ♀, and *A. cephalonica* ♂, raised by M. H. L. de Vilmorin himself. We have before alluded to the microscopical structure of the leaves of this plant. *Abies Nordmanniana*, *A. numidica*, and *A. cilicica* are each well represented.

*Larix dahurica* is bearing cones freely, as also is the interesting golden Larch, *Pseudolarix Kämpferi*. The scales of this Conifer are deciduous, and leave behind them a central core, as in *Abies* (Silver Fir), but this core, in place of being solid and woody, is fibrous. One of the most interesting trees in the garden at Verrières is a tree of *Pinus Murrayana*, grafted on the Scotch Pine, and which is now flourishing. M. de Vilmorin observing that his seedling plants were dwindling and dying, grafted one as above-mentioned; this has succeeded, whilst all the seedlings died.

The trial-grounds are models of accuracy and precision, more like laboratory experiments than the usual rough-and-ready field trials. How many thousand plots there are we hesitate to say, nor how many control plots by which the results may be checked. In addition to the ordinary field and garden crops, here may be seen plots and quarters of vegetable, &c., little or not at all grown in this country, such as the Chou Moellière, a tall Cabbage with succulent stems, which are cut in pieces and stored like Swedes, than which, however, they are not so hardy. Here, too, are breadths of a peculiar variety of Cabbage, with dark-green shining leaves, not at all glaucous, but resembling in colour the leaves of the Laurel-Cherry; these "glazed" Cabbages are grown for the American market. But to attempt to enumerate even a fraction of the interesting forms grown here would demand more space than we could give.

It was early winter when we had the opportunity of seeing the trial-grounds, but we could not be struck even then with the extreme care taken to secure trustworthy results, and with the great value of the trials to the student of variation.

## TREES AND SHRUBS.

## SENECIO PLATANIFOLIUS.

MR. GUMBLETON obligingly tells us that he has now coming into flower for the first time an exceedingly handsome foliage shrub, *Senecio platanifolius*, with large, thick leaves resembling green velvet in texture. Though quite a small plant in a pot, and not a foot high, the plant is sending up quite a surprising spike of bloom with twelve bunches of flowers, and in height almost, if not quite, as long as the plant that bears it. It is most unusual for so large-leaved a plant to bloom at all in so very small a state, as when full-grown it is presumably a coarse grower. Mr. Gumbleton has also succeeded in raising a nice little lot of seedlings of the fine New Zealand purple-flowered *Forget-me-not*, *Myosotis capitata*, which is figured in *Flora Antartica*, vol. 1, plate 37, and which Sir J. D. Hooker says is the most beautiful of all the New Zealand species.

**CATTLEYA LABIATA WITH TWO LEAVES.**

In the *Gardeners' Chronicle* for September 21 of last year, at p. 339, is a note on a *Cattleya labiata* which produces in some seasons single-leaved pseudo-bulbs, and in others two-leaved. We are now indebted to Mr. Francis H. Moors for the opportunity of illustrating (fig. 2) a two-leaved pseudo-bulb. Whether this is due to a little extra vigour in the plant, whether it is a reversion to a former condition, or whether it may be an evidence of former hybridisation and dissociation of heretofore blended characters are all points that may be discussed but hardly settled.

**FORESTRY.**

**TIMBER VERSUS GAME.**

"S.'s" argument that timber-growing and game preserving can be combined in the same wood may be sound enough in itself, but the difficulty is to

be anything to fell or thin. As for planting, if done at all, it is entirely confined to the formation of new covers, about which our nurserymen could tell many a tale.

In the north of England and Scotland, or on a few large estates throughout the country, we may not find the head of game always regarded as the criterion by which the value of a wood is judged, but it is, nevertheless, a fact, that the economic aspect of plantations never receives serious consideration in this country. Until it does, the forester might almost as well take "S.'s" advice, and study philo-sophy rather than forestry. Ten years after planting, any plantation can be used as a game-cover, and ninety-nine out of a hundred are so used, and the development of the trees becomes a matter of secondary importance. The improvement of woodlands is not a source of profit to those who carry it out, and for this reason alone it can never be more than an occasional undertaking on private estates.

The majority of proprietors, like Mr. Elwes, regard economic forestry as an unprofitable way of employing their spare capital, for the obvious reason that

is usually made, and not born, and in many cases a toes-up might have decided whether his career was to be that of a game-keeper, forester, or gardener. We all live in a little world of our own, and the smaller the world, the more we magnify it. The tail-feather of a pheasant is more precious in the keeper's sight than a promising young plantation, or the reputation of a forester. He usually divides mankind into two classes—game-preservers and game-disturbers, and if the forester belongs to the latter, he is rarely thanked by his employer, or blessed by the keeper. If the latter is a sensible and intelligent man (and we meet with keepers who are such sometimes), he will prevent all avoidable damage being done to young trees as much as possible. If he does not do this, the owner can see the mischief, and has the remedy in his own hands; but in most cases this is more readily overlooked than is a lack of game. I have still enough charity left in my nature to abstain from the wish (devout though it may be) that keepers should be placed under the control of foresters, and be expected to satisfy their employers at the same time. The end

FIG. 2.—CATTLEYA LABIATA WITH TWO LEAVES.

FIG. 3.—BRANCHED PSEUDO-BULB OF LELIA. (SEE P. 12.)

convince game-keepers and sporting proprietors of the fact. The game-keeper's *beau ideal* of a covert is a mass of brambles, rough grass, or any other rubbish, with just sufficient trees on the ground for pheasants to roost in or to provide shelter for; anything beyond this he considers objectionable, for the simple reason that it furnishes an excuse for someone besides himself to cross the boundary once or twice in the non-shooting season. Ardent sportsmen, who care little or nothing for timber or even trees, are only too ready to acquiesce in plans which cost them nothing, and in nine cases out of ten the system of forestry practised on English estates is the "game-keeper's system." The forester or woodman, providing he does not get off the rides or make a noise, is allowed to walk about in the woods at most seasons of the year, but it is only during the first three months of it that he can get anything done in the shape of felling or thinning, supposing there should

the money so spent is practically lost to them, and most of it to their sons, and it is only the third and fourth generations that get the full benefit. Agricultural depression also tends to curtail rather than encourage expenditure on all work not absolutely necessary on estates. Until the Government recognises the national importance of forestry, and is willing to give it the assistance it requires, we cannot expect estate owners to do much in the matter. The pecuniary returns alone do not represent the full value of State forests on poor land to the nation at large, as the advantages they confer are indirect rather than direct, and we find no record of any continental nation having abandoned State forestry as useless and unprofitable after it has once been instituted on a sound basis.

In the meantime, I do not see what good can be effected by waging secret warfare against the game-keeper, as suggested by "S." Unlike the poet, he

would not, I fear, be peace until the millennium. A. C. Forbes.

**PRICES OF BRITISH-GROWN TIMBER.**

Mr. Webster must live in a favoured locality, to obtain from 10d. to 1s. per foot for Beech grown on chalky soils. I live where chalk abounds and Beech trees flourish, but I cannot get more than 8d. per foot for clean good timber. We are now contemplating cutting a number of trees, many of them being 17 inches quarter girth, and of sufficient length to come out at 40 feet of timber, or more.

Hedgerow-grown Beeches are of little use as timber trees in this part. Trees freely knotted are rejected by timber merchants about here.

Much of the Beech sawn up in this neighbourhood is used for pianofortes, small pieces coming in for brush-heads of many kinds. As Mr. Webster truly remarks, Scotch Fir is of little value; 4d. per foot is

the top price offered. Not far from where I write there is much Crown land under timber cultivation. Many acres are planted with Scotch Fir, which grows apace in the sandy-gravelly soil there. Here too in the chalky as well as in the heavy retentive soil of other parts of the estate this Pine grows fast and straight. In some cases it overtops the Larch alongside. This, however, is an exception, the latter as a rule, makes more progress than the Scotch Pine.

The idea prevailing amongst some Crown foresters is that in time to come the Baltic timber will be exhausted and then Scotch Fir will be more eagerly sought after. How far such theories will prove correct is a matter for the future. I find that Scotch Fir gives more trouble in regard to maintaining the trees with perfect leaders than any other variety of either the Pine or any other family. I have noticed, too, that during exceptionally dry-weather spells, at a time when the new shoots are bareting into growth in the spring, the most damage takes place to the leaders. The arid or dry state of the atmosphere seems to check the first stage of growth of the leader. This refuses to grow, and instead of one shoot taking the lead, as it ought, there are in some cases as many as four, and sometimes more than that even, struggling for the mastery. At the end of the year's growth, all of these shoots will be on an equality as to length; the tree is then without a leader, necessitating the removal of all but one. It is surprising, too, how quickly the one retained straightens itself and assumes the leadership, eventually growing quite straight. Where the pruning is carefully done, in a few years' time such trees lose all signs of what might have remained a perfect disfigurement. I find trees under 15 feet high are much more liable to give trouble with the leading shoot than when beyond that height.

Larch is undoubtedly the favourite of present-day planters in this neighbourhood. Trees under eighteen years old are, however, of little value. At one time there was a brisk demand for them for Hop-poles, but now that wire and Cocoa-nut fibre string is so largely employed Larch is not required, and pays much better if allowed to remain long enough to grow into rail size.

Although Ash fetches a good price, but little of this wood is planted; the growth is but slow.

The Corsican Pine is fast finding favour with planters; the growth is so clean and straight that it will in the future oust the Scotch Fir from public favour. The great fault is its liability to die when planted, especially if trees beyond 1 foot are chosen. Those 6 inches high are much safer for planting. Where Austrian Pine is planted pretty thickly, the growth is quite equal to Corsican, but in the open the Austrian is not a good timber-growing tree. The rapid growth of its branches seems to prevent the fast progress necessary to make good, clean timber. Where planted 4 to 5 feet apart, the trees "draw up" rapidly.

I have much faith in *Thuja gigantea* (Lobbi) as a timber tree; it will grow nearly, if not quite, as fast as Larch, the strongest of soil appearing to suit its progress as well as that which is sandy. From one or two well-established trees abundance of seed can be obtained annually; this, if sown in boxes in a cool-house in October soon make stocky plants. We planted 2000 trees of this *Thuja* amongst Larch five years since as an experiment, and their present rate of progress appears to warrant the trial. *E. McInnes, Swanmore, South Hants.*

## THE WEEK'S WORK.

### FRUITS UNDER GLASS

*By W. POPE, Gardener, Highclere Castle, Newbury.*

**LATE VINERIES.**—Where Grapes are required to remain on the Vines for some time longer, a dry, buoyant atmosphere should be maintained in the vinery, and the temperature kept at about 45° to 50° by gentle firing, air being given on all favourable occasions, putting a little extra heat into the pipes for an hour or two in the middle of the day when this is done, so that all damp may be expelled. Should the weather be very foggy or otherwise damp-laden, keep the vinery closed, or at the most afford but a slight chink of air at the top. The bunches of Grapes should be examined three or four times a week, cutting out all berries showing signs of decay. Where the vinery is utilised for storing plants, it

will be safest to cut the bunches together with six inches of the shoot, and to stick the latter into bottles of clean soft water, putting a few small bits of charcoal in each bottle. Place them in a dark dry room, with a temperature of 40° to 45°, and examine the bunches occasionally for decaying berries, and fill up the bottles. Bottled Grapes, if the conditions are right, keep better than on the Vines, and the latter are benefited by their removal, besides having a longer season of rest. When the Grapes are cleared from the Vines, pruning and dressing may at once be undertaken, and on the completion of those jobs, the woodwork, glass, and trellises should be cleaned with warm soap-suds, the walls lime-washed, and the woodwork painted where necessary. If the Vines were infested with red-spider or other insects, remove the loose portions of the bark, and scrub them all over with a weak solution of soft-soap, using a moderately hard brush for the purpose. If mealy-bug be present, a wine-glassful of petroleum may be added to each gallon of the wash. In manipulating Vines at this season, especial care must be taken not to damage the buds. After the washing, the canes may be painted with Gishurst Compound, at the rate of 4 oz. to the gallon of water, working this into all angles and the crevices of the bark. The surface-soil of inside borders should be shovelled off, and a top-dressing of fibry loam afforded, enriched with an approved special Vine-manure. The forcing of Vines to carry ripe fruit in June should now commence, and if the borders are outside ones, they will probably have been covered with dry leaves or litter to conserve warmth in the soil, with waterproof coverings over all. If the Vine-border is inside the vinery, a bed of leaves and manure may be made up in the house, turning this every day or two, which will lessen the amount of fire-heat needed for a time, and is beneficial to the Vines till the buds are in a forward state. If fire-heat alone is employed, the Vines must be syringed two or three times daily with tepid water till they burst into leaf, and let temperature be kept at starting at from 45° to 50° with fire-heat, increasing it 1° or 2° weekly till the Vines arrive at this state. See that all inside borders are thoroughly moistened; and when water is afforded, let it be slightly warmer than the temperature of the house.

### THE KITCHEN GARDEN

*By C. HERRIN, Gardener, Droghmore, Maidenhead.*

**PROSPECTIVE.**—At the New Year, with its hopes and aspirations to excel in the culture of the various occupants of the kitchen garden, should come to the private gardener, whether he be a grower for exhibition or not, the resolve to supply his employer's table abundantly with choice vegetables throughout the coming year.

**BROCCOLI.**—The weather as yet having been, comparatively speaking, open, green vegetables are still plentiful, but care should be taken to protect any that require it on the first approach of severe frost, the succulent nature of the growth consequent on the mild weather making them less able to withstand severe frost, such as may visit us at any time. Our supply of Cauliflowers and early Broccoli has so far proved excellent, and at the present time consists of two varieties of the latter, viz. Self-protecting Autumn, and Snow's Winter White, and although 10° of frost were experienced on one or two occasions, there has not been any spell of severe frost to injure the Broccoli in the early stages of heading-in. The precaution is taken to go through the quarters at the least once a week, and carefully lift all the plants the heads of which have attained the size of a shilling, keeping the soil and roots intact as far as possible, and to transplant into trenches prepared to receive them, planting them so as to form a compact bed, where, if frost appears probable, they can be covered with bracken, a bracken-wall being built up round the sides as a protection against the wind. It is found that by lifting carefully, very slight check is given to the formation of the head, and unless growth is arrested by very severe frosts, almost a daily supply of nice heads from 2 to 3 inches in diameter can thus be kept up till the spring Broccoli turn in later on.

**CELERY** is another kind of vegetable easily spoiled by severe frost, and if once it be badly frozen, decay is sure to set in however well it may afterwards be covered. To guard against loss, therefore, sufficient covering materials should be placed in readiness for use on the shortest notice. In these gardens we have a good supply of bracken always at hand, and this is used exclusively for covering

purposes—still, any other litter is applicable. Where circumstances permit, two boards nailed together V-shape will prove an additional protection, taking care to remove these and all other coverings in mild weather.

**ROOT-CROPS.**—If not already done, a portion of the crops of Parsnip, Jerusalem Artichoke, Stachys tuberosa, and Salsafy should be similarly covered with litter, that is assuming that these roots are left in the ground for lifting when required for use, which is the method to be generally recommended. Leeks also should receive some protection from litter, otherwise severe frost adds to the difficulty of lifting them. A quantity may be lifted and laid in soil close together for the convenience of covering. I leave a goodly proportion of our Carrot crops where they grew, spreading a little bracken over them on the approach of frost, and find in this way that they keep remarkably well, and are quite equal if not superior when used to those lifted and stored in the orthodox way. Where storeroom accommodation is limited, these root-crops may be left in the ground until it is required for preparation for other crops in the spring.

**GLOBE ARTICHOKE.**—These plants being very susceptible to injury by frost, should be well protected with light, strawy litter or bracken, covering the plants completely, but always removing the top covering in mild weather. A portion of the stock of these plants should be transplanted in the autumn, planting good, strong single suckers, and these will be found to withstand frost much better than the larger and old stock plants.

**CLEARING-UP THE QUARTERS.**—The dead and decaying leaves on Brussels Sprouts, Broccoli, Colewort, winter Greens, and Parsley should be carefully removed, such decaying refuse being inimical to the hardiness of the plants, has a bad odour, and an untidy appearance.

### THE FLOWER GARDEN.

*By HEDLEY WARREN, Gardener, Aston Clinton, Tring.*

**MISCELLANEOUS WORK.**—In anticipation of severe weather, sufficient protection should be afforded plants and shrubs in exposed places not sufficiently hardy to withstand very inclement weather, cold cutting winds oftentimes doing far more injury than severe frost. In either case, mats, bracken Fern, or branches of evergreens may be used with advantage. Those recently planted should also be protected at their roots by a good mulching of suitable material, and if of large dimensions, some support should be given to prevent disturbance at the roots. Gravel paths may also receive attention by way of adding fresh gravel where necessary, and by turning them in places where worn or discoloured, rolling well on all favourable occasions if they are required to be kept in a firm condition. Attend to grass verges, and lay down new turf where required. Any bulbs that remain unplanted should be attended to with all possible despatch, these affording a pleasing contrast if planted along the outskirts of shrubberies, and in patches on the lawns, always, however, avoiding anything approaching formality in the planting, or any desired natural effect will be destroyed. If not already done, beds devoted entirely to bulbs should be afforded a mulch of Cocoa-nut fibre refuse, or half-decayed leaf-mould. Christmas Roses should be protected, movable hand-lights being much the best aid to employ for this purpose; or if planted in beds of suitable size, a frame may be placed over the whole, removing the lights on all favourable occasions. Treated thus, Christmas Rose blooms come of excellent quality, and at this dull period of the year are greatly valued, none the less so on account of their lasting qualities, and of their being obtainable in an outdoor garden.

**ROSES, TREES, SHRUBS, ETC.**—These may also be planted should mild weather continue. In selecting the former, due attention should be paid to the selection of those varieties which came safely through the trying ordeal of last winter. Should the nature of the soil permit, dwarf Roses should be planted low, which will largely lessen the annual losses from frost. If in the planting of permanent beds a good sprinkling of crushed bones and soot can be given, the outlay will be amply repaid later on, by having robust, healthy plants and finer blooms. When planting is completed, mulch the roots with half-rotten manure or bracken Fern, the latter being one of the best materials that can be used. Where necessary, new stakes and ties should be given to

standards; in fact, everything in the Rose garden should now be made as safe and snug as possible without delay.

**NEW SHRUBBERIES.**—In making these, due regard should be given to the surroundings, and if possible, a plan of the intended planting or alterations should be made prior to its commencement, and in that way each tree can be indicated and a position assigned to it suitable to its habit and character, always affording plenty of space to the trees and shrubs so that the natural habit of each can be observed, and where each will appear to the best advantage; by doing this, a vast amount of future labour in the way of re-arrangement will be saved, and branch mutilation avoided. The pruning of deciduous and other trees may likewise be proceeded with, which should mainly consist of thinning-out the branches where crowded, and the removal of all dead or decaying wood; in some instances a shortening-back of the branches of robust-growing trees may be necessary, but a good deal of judgment is required in this matter.

**WALLS, ARCHES, ETC.** which would otherwise be unsightly, may be made both useful and pretty, by planting at the base such plants as climbing Roses, *Rosa rugosa*, Honey-suckle, Jasmines, *Pyraeanthus Lelandi*, Clematis, Cotoneasters, variegated Ivies, *Climocanthus fragrans*, *Escallonia macrantha*, *Ceanothus* in variety, *Magnolia grandiflora*, *Ampelopsis Veitchii*, muralis, &c.; *Vitis* in variety, *Wistaria sinensis*, and other suitable subjects.

**THE ORCHID HOUSES.**

By W. H. WHITE, *Bu ford, Dorset.*

**THE HOUSES.**—For the benefit of beginners in the cultivation of Orchids, it may be well to enumerate the various glasshouses in which these plants are usually grown, giving also the respective degrees of warmth found conducive to the health of the plants at this season of the year. By night the warmth of the East Indian or warmest house should when maintained by fire-heat range from 60° to 65°; the Cattleya or intermediate-house 55° to 60°; Mexican about 55°, and the *Odontoglossum*-house, 50°; although during very cold weather the degree of warmth during the night, the warmth owing to the extra fire-heat used, being somewhat drier than at other times, may fall a few degrees with benefit to the plants. During the past two months the degree of warmth at night has only been on one or two occasions below the above figures, although on some days with sun-heat the temperatures have been several degrees above those given, but then air has been gradually admitted to the houses whenever practicable. It need not be supposed that special houses are a pressing necessity for Orchid culture, and evidence showing this has often appeared in these pages, and also the perfection to which some gardeners cultivate *Calanthes*, *Dendrobium*, *Taonia*, *Cypripedium*, *Colognes*, Mexican *Laelias*, &c., in the ordinary hot-house, Cucumber-house, and vinery. Where large numbers of certain species have to be grown well, it is, however, advisable to afford them a house as at Barford, where, besides those mentioned, houses are set apart for *Astrides*, *Masdevallias*, *Cypripedium*—a cool intermediate-house, with a temperature a few degrees higher than that of the *Odontoglossum*-house. Such a structure as this is very convenient, especially for cultivating *Miltonia vexillaria*, and others of that family; *Sobralias*, *Epidendrum*, *Maxillarias*, *Cymbidiums*, *Lycastes*, *Laelia harpophylla*, *L. monophylla*, *Oacidium*, and *Cypripedium insigne*, *C. Spicerianum*, *C. Leeanum* × *C. Schlimi*, *C. villanum*, *C. Boxallii*, *C. Charlesworthii*, *C. Fairianum*, and some others. Where no such ample accommodation exists, the warmer part of the cool-house or a cool one in the Cattleya-house have to be utilised. Orchid cultivators possessing only the first-named divisions, need not fail to grow satisfactorily the majority of tropical Orchids, providing the ordinary requirements of the plants are attended to. Each plant should be under their personal care, noting the conditions under which it succeeds, whether on the bright or the shady side of the house, at a cool or warmer part, and a variety of circumstances which strike the observant grower. The lack of sunshine lately has been unfavourable to some species, especially to those which are now forming their flower-buds, but the prevailing mildness has rendered much fire-heat unnecessary, and the external air, being moist, very little damping-down in either division was or is required. The paths and stage of the East Indian-house should be well syringed in the

morning, when the thermometer shows the required degree of warmth has been reached; in the afternoon, and at night, should fire-heat be necessary, the paths may again be sprinkled. As regards the Cattleya or Mexican division, a less moist air will be required whilst mild weather prevails, and a moderate damping two or three times a week will suffice. The cool-houses need scarcely any damping, the watering of the plants and the washing of the floors affording as much moisture as the plants need. During the middle of the day the atmosphere of the houses may become moderately dry, but no damping should be done, or "spot" may appear on the plants. Afford a moderate amount of air to the plants in all the divisions when the weather is favourable for doing so.

**PLANTS UNDER GLASS.**

By J. S. McINTYRE, *Gardener, Wolside, Dirlington.*

At the commencement of each year the gardener should mature his plans for the season. He should look over the various plant departments, and carefully note the successes and the failures of the past season. By such study, many mistakes may be avoided where failure previously occurred, and further improvement may be attained. All work in connection with plants must be done promptly, at the correct time, and nothing should be effected in a haphazard manner. In a regular systematic method will be found the way to success in plant cultivation.

**THE CONSERVATORY.**—If this structure is attached to the mansion, the watering of the plants and the removal of decayed leaves, &c., should be done in the morning; but in severe weather, the removal of plants from the forcing-house, or other warm structures to the conservatory, cannot be accomplished without injury. In winter we do all such work on Saturdays, and select the warmest part of the day. In the arrangement of most conservatories there is a great tendency to overcrowd the plants, and this must be guarded against. It will be difficult to keep the conservatory gay with flowers at this season, and the display of *Caryanthemum* during the past two months will make any deficiency the more apparent.

**FORCING HOUSES.**—Lift a good batch of *Dielytra spectabilis*, and pot the clumps up into any old soil. They will turn in rapidly, and are bright showy plants. Imported roots of these are much better, and if expense has not to be considered, should be used in preference to those from the borders. Encourage with all speed a good quantity of *Narcissus*, which having now made roots, and showing their young growth, may be removed from the planting material and put in a temperature of 45° or 50°. In this way a good show of *Narcissus* may be had by the end of January. Pot up a quantity of *Astilbe* (*Spiraea*) *japonica*, which has been in the open ground a couple of years; they will produce a moderate quantity of flowers, and the green foliage is most useful for cutting from. Imported clumps of *Spiraea* do not lend themselves so well to early forcing, but a first batch of these may now be placed in gentle heat. Roman *Hyacinths* being now almost over, it is well to introduce into heat each fortnight a quantity of the *Hyacinth* grown in colours. A light airy shelf near the glass in a temperature of about 50° at night will be best for them, and in order to obtain large spikes of flower, a little liquid-manure should be given at every alternate watering. Sheep-manure is one of the best natural manures, or Clay's or Thompson's artificial manures suit *Hyacinths* well. A good batch of *Tulips* should be introduced into heat every ten days; they are easily forced, and are very showy. In growing *Tulips* for house decoration, select four or six of the finest large-flowering varieties, and grow them in quantity, in order that a good mass of one colour can be had at any one time. The *Pottsbakker White*, *Kaiser's Crown*, *Cottage Maid*, *Vermilion Brilliant*, and *Proserpine* are all good and useful varieties.

**PROPAGATING HOUSES** and cases should now be overhauled, thoroughly cleaned, and all put ready for active work. It is a good time to propagate some of the stronger-growing stove plants, such as *Anthurium Andreanum*. This plant, in the course of a year after propagating, becomes leggy, but where nice dwarf plants are wanted, it is better to propagate annually. The tops, if taken off with the aerial roots at this season, and if placed in 4 inch pots, using sphagnum moss and fibrous peat, and placed in a close structure for a few weeks, make good useful flowering plants the same season. After

topping, place the old stools in the warmest end of the stove, they will then produce three or four shoots which, as soon as large enough, can be taken off and propagated, if increase is desirable. I prefer this plant for all decorative purposes with single stems grown very strong, and carrying one or two large spathes. Part of the stock of *Gloxinias* should now be started in order that they may flower early. The earliest of these should not be re-potted, they are better grown on in the same pots. Remove all loose surface soil and top-dress afresh with soil of a light, rich nature. Treated thus, they can be had much sooner in flower. When they are making strong growth, assist them with a little good fertilising manure.

**THE HARDY FRUIT GARDEN.**

By G. WOODGATE, *Gardener, Kollaston Hill, Burton-on-Trent.*

**PLANTING**—All fruit-tree planting should be completed with the least possible delay, so that the roots may become established in the soil before the growing season commences. When planting, remove all broken and braised roots with a sharp knife, making a clean cut from the under side upwards, so that the fibrous roots which will grow from the point where the old roots were cut may run in a horizontal position, and remain near the surface of the soil, where they will be influenced by air and warmth. It is not yet too late to take up and replant any young trees that have shown a tendency to grossness, but remove them very carefully. Shorten the main coarse roots by a clean cut, and remove entirely any that have a direct downward growth. In the case of standard trees, endeavour to plant when the soil is fairly dry, so that the earth may be firmly trodden, and the stems should be made secure by fastening them to a strong stake. These should be just long enough, after being driven into the ground, to allow of the upper tie being made close under the head of the tree, but quite clear of the side branches. If there should be any probability of the stem touching the stake through being bent, let it be tied again at that place to prevent any friction. Pieces of hop-backing cut in strips 4 inches wide and of sufficient length to go about twice round the stem, form a capital substitute for hay-bands, but all such ties on young trees ought to be renewed with fresh material annually, so as not to check the natural swelling of the stem, and to prevent the harbouring of insects. When planting trees against a wall, keep the stem a few inches away at the bottom, and let the tree incline slightly to the wall. It often happens at this season of the year, that the soil in north and east borders is cold and wet, and if it be found necessary to plant under such conditions, some dry soil should be at hand to place among and over the roots. For this purpose use some good sandy loam, with a fair proportion of wood-ashes, or burnt garden-refuse and road grit. This compost will greatly facilitate root-action; finish off with the ordinary soil, and tread lightly, letting the trees and soil settle down together. If the branches require support, tie them loosely, but wall trees and espaliers should not be fixed in their position by tying or nailing until at least a month after planting.

**PRUNING**, if not completed, should be pushed forward on every opportunity, but not if the branches are frozen. Peaches and Nectarines are best left till last. In pruning wall trees remove all ties and take away all old string, ruffin, or shreds; the last-named, however, if good, may be used again after being cleared of insects by immersion in boiling water for a short time. Brush the walls with a stiff brush or broom, and well syringe them with a strong solution of soapy water, adding a half-pint of petroleum to every four gallons. When syringing south walls, on which Peaches and Nectarines are grown, a good handful of sulphur thrown into each four-gallon water-pot of the solution will assist greatly in keeping red-spider in check during the summer. The trees may be sprayed with the same mixture, which must be well stirred during its application. The stem and larger branches may with advantage be painted over at the same time, a half worn-out painter's brush answering well for the purpose. Tie or nail in the trees without delay, so as to prevent any loss of buds through friction by wind. If any grafts are required for use this season they should be taken off as soon as possible, and labelled correctly. Lay them in by their heels in a cool sheltered border. Cut back the branches of any trees it is intended to graft to within a few inches of where the grafts will be inserted.

## EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Letters for Publication.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

## APPOINTMENTS FOR JANUARY.

## MEETINGS AND SHOWS.

SATURDAY,	JAN. 4	{ Isle of Wight Hort. Improvement Association meet.
SUNDAY,	JAN. 5	{ Royal Horticultural and Agricultural Society of Ghent Show.
FRIDAY,	JAN. 10	{ Annual meeting of the Gardeners' Royal Benevolent Institution at Simpson's, Strand.
SATURDAY,	JAN. 11	{ Royal Botanic Society meet.
SUNDAY,	JAN. 12	{ Brussels Orchidifera Show.
TUESDAY,	JAN. 14	{ Royal Horticultural Society's Committees Show.
THURSDAY,	JAN. 16	{ Linnean Society.
SATURDAY,	JAN. 25	{ Royal Botanic Society meet.

## SALES FOR THE ENSUING WEEK.

MONDAY,	JAN. 6	{ Continental Plants, Roses, Hardy Border Plants, Greenhouse Ferns, &c., at Protheroe & Morris' Rooms.
THURSDAY,	JAN. 9	{ Lilies, Begonias, Spiræas, &c., at Protheroe & Morris' Rooms.
FRIDAY,	JAN. 10	{ Imported Orchids at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—36°3'.

The Potato Crop of 1895. THE United Kingdom and the Continent of Europe generally harvested a large crop of Potatoes last year. Seasonable temperatures and usually sufficient rainfall materially increased the average yield per acre compared with the season of 1894, when the crop had considerable deterring climatic influences with which to contend. In England the yield was rather under the average last year, as it was also in area, although both were in excess of 1894. Late Potatoes did better than early varieties, and disease was prevalent in some counties. There was little complaint from Scotland, either in yield of produce or from disease. In Ireland the crop was very good, both in quantity and quality. On the Continent reports are generally favourable outside of Italy, which is never much of a Potato country, yielding in the average of years only about 700,000 tons. France had a good output of Potatoes, and prices promise to remain low. That country, compared with Great Britain, has about six times the area under the Potato crop, but yields less than three times as much aggregate produce, and gives considerably less than three tons per acre, that is less than half as much per acre as Great Britain, and even considerably less than Ireland. In Germany the Potato yield is reported to be especially large, although many of the tubers are deficient in size. The percentage of loss through disease is less than in 1894.

Although enormous quantities of Potatoes are produced, continental countries as a rule consume all they grow at home, and have little to export, aside from France and Germany, and to some extent the Netherlands, which ship their surplus to England.

We learn from the *American Agriculturist* that the Potato yield in the United States was abnormally large, but unwieldy only in the western districts. The above-mentioned journal also furnishes the estimated yield of Potatoes for 1894 and 1895, which are made up from the best data obtainable, and brought down to harvest time, although owing to absence of thorough crop-reporting in some of the continental countries, the figures are subject to modifications:—

Country.	Acres.	Total Crop (Bushels).	
		1895.	1894.
United Kingdom ...	1,252,900	192,500,000	172,494,000
United States ...	3,204,000	282,148,000	185,000,000
France ...	3,851,000	443,200,000	393,000,000
Germany ...	7,525,000	1,106,000,000	940,875,000
Austria ...	2,738,000	308,700,000	271,565,000
Hungary ...	1,153,000	118,760,000	101,700,000
Canada ...	492,100	53,956,000	44,854,000
Belgium ...	515,000	141,625,000	127,500,000
Denmark ...	140,000	19,600,000	15,290,000
Holland ...	375,000	90,000,000	80,000,000
Italy ...	411,000	26,460,000	27,000,000
Russia ...	6,234,000	611,000,000	555,000,000
Sweden ...	395,000	57,670,000	50,251,000
Norway ...	89,000	25,810,000	22,250,000

The foregoing data show that in the fourteen countries enumerated, every one except Italy yielded a larger crop of Potatoes in 1895 than in 1894, and most of them considerably more. In the United States, as we learn from the *American Agriculturist*, the crop was not only large, but was by far the largest ever grown. The acreage was suddenly increased out of all proportion to the demands for consumption, in response to ill-advised suggestions from high official sources, coupled with a natural desire of the farmers to replace Wheat in the north-west with some more-paying crop.

The result is what might have been expected, a crop furnishing a heavy surplus above food requirements, and this surplus, especially in the north-west, having no adequate outlet at present, crushed prices to a level below the cost of production, in some sections. In fact, in many districts, in the north-west especially, growers abandoned the results of their year's work, and did not dig their crop, prices not paying the cost of digging and hauling.

But for the enormous increase in that section, the total crop of the country would not be excessive, but the surplus there pressing for market was felt by growers all over the country. The estimated average area under the Potato crop in the United States is 2,197,877 acres, against 3,204,000 in the season just closed. The average aggregate produce of marketable tubers is 4,139,313 tons; while the crop of last year is placed at 7,053,700 tons, the estimated average rate of yield being eighty-eight bushels per acre, that is about one-half as much as Great Britain for the present year, so that the crushing crop of 1895 resulted from an enormous acreage, rather than a phenomenal rate of yield. The variation in produce in different States was more marked than usual. New England returned only a fair average; while New York showed a good yield in spite of local damage to the early crop from drought. In the Ohio Valley, the season for early Potatoes was marked by severe drought, which lasted late enough to damage the first growth of latter plantings. This condition cut short the early crop, and robbed late fields of the vigour of haulm necessary to a full yield. The increased acreage in New England and propitious weather until late summer, was

followed by such a general attack of blight and disease, that the crop was ultimately out down materially. In Aroostook, Me., the world-famous Potato county, loss in this direction was serious, but yield was still large, with an area 20 per cent. larger than last year; and starch-factories were working up large quantities purchased at 14 to 20 cents per bushel.

In the southern States the crop of white Potatoes was good, furnishing a full supply for domestic wants, and limited quantities in excess for shipment. The New Jersey crop was called upon to supply many of the western markets, where there was a deficiency in home-grown, and growers were placing in cold storage a considerable proportion of the best stock, sending the poorer grades to market. The increased area and yield in Colorado and on the Pacific coast gave the Rocky Mountain States a surplus.

Canada was no exception to the rule of a bountiful crop, the 1895 yield closely approximating to 57 millions of bushels, showing a material increase over the previous year's short crop. Returns to growers have been very unsatisfactory since the opening of the season, with prices so low that, where possible, stock is held.

Following the 40 per cent. reduction in the tariff, admitting Potatoes in the United States at the low rate of duty of 15 cents per bushel, there was considerable stimulus toward increased acreage, especially in Ontario, Quebec, and Nova Scotia. This, with good weather conditions, and freedom from serious blight, resulted in an unusually large tonnage, and growers were confronted with a poor outlet either on European account, or to the United States, and in remote sections many fields were unharvested, or the tubers were set aside for feeding live-stock. The quality of Canadian Potatoes was in the main good to excellent.

While many growers were disposed to hold for better prices, the majority have shown a willingness to sell at anything like reasonable figures, owing to the general conditions. Far less complaint was heard of disease than in America, yet there was some loss in this direction, especially in Nova Scotia, New Brunswick, and portions of Quebec. While Canada usually depends considerably upon her export trade, this, compared with the volume of the crop, does not amount to much after all. The Canadian export of Potatoes, for the three last years ending June 30 in each year, was for 1893, 1,112,833 bushels; 1894, 1,007,576 bushels; 1895, 1,379,042 bushels.

## DISTRIBUTION OF THE AMERICAN CROP.

The market outlook is acknowledged to be rather mixed, but the situation when closely studied presents some features which may eventually do much to bring about a better state of things. Prices are almost unprecedentedly low in every direction, due in some sections to actual conditions, and in others partly to sentiment. While a record-breaker, the crop of 1895 is only about 12 per cent. larger than was that of 1891, when the December farm price was 37 cents, or perhaps 10 cents higher than now. The 1895 crop was top-heavy, chiefly in the north-west, and should not be regarded as unmanageable elsewhere. The principal increase serving to swell the total figures, was in those sections far removed from markets.

Rates of freight were so high that shippers could in many instances do nothing, and the Potatoes grown in large areas, considerable quantities of which were not harvested, will never come into direct competition with the crop in the older States.

In addition to the abandonment of a part of the

crop in the north-west, there was a tendency towards excessive rotting of the tubers in many portions of the country. Together, these facts may result in relieving the congested conditions, and eventually bring an improvement in prices.

The distribution is unfortunate, the surplus production being confined chiefly to a few States far from consuming centres, but exerting a secondary and, for the time being, disastrous influence on the moderate crop grown elsewhere. With the knowledge of a bumper crop, taking the country at large, buyers and dealers have

to see these striking plants on payment of a small fee, the total amount being given to a charity. No doubt, Mr. FRIEND had some difficulty in dispelling the popular error that these plants are Aloe, and that they only flower once in a century. There are some errors which appear to live for ever, and these are of them.

**LINNEAN SOCIETY.**—On the occasion of the meeting held on Thursday, December 19, Mr. W. P. SLADEN, V.P., in the chair, Mr. William Scott was elected, and the Rev. T. R. Stebbins, Rev. H. P. Fitzgerald, and Mr. A. W. Giffcken were admitted

an economic plant. Mr. Rolfe gave an account of the morphology and mode of fertilisation of the genus, its affinities, geographical distribution, and an enumeration of the species, with descriptions. As indicating a still imperfect knowledge of the genus, he remarked that it was even now uncertain to what species the Peruvian plant with aromatic fruits belonged which was noticed by Humboldt more than eighty years ago. The paper was illustrated by a series of carefully-made drawings.

**THE ROYAL HORTICULTURAL SOCIETY.**—The secretary writes as follows: "It would hardly be consistent with my duty to the Council of the Royal Horticultural Society for me to enter into any discussion in your columns as to the merits of any suggestions that may be made for the improvement of the society. Knowing, however, so well what is the real mind of the Council, and sharing myself to the fullest possible extent in their earnest desire and endeavour to do anything and everything that may tend to promote the true interests and well-being of the society, I ask you to allow me to state that all suggestions made in the courteous spirit of your correspondents on pp. 774 and 775 of the last volume, and recognising as they do that there are difficulties to be overcome, will, I am certain, be always most carefully considered by the Council, with a view to the adoption of such of them as may be found practically feasible. May I further remark that definite suggestions and definite action will, I am sure, always be received by the Council with the attention which they deserve, whilst vague generalities seldom lead to any useful result. I am, faithfully yours, W. WILKS."

**MR. BARRON'S RETIREMENT.**—At the invitation of Mr. BARRON, the *employés* in the Chiswick Gardens assembled to dine together on the 21st ult. In a speech referring to his retirement from the superintendence of the gardens, Mr. BARRON expressed much regret. Being proud of many of the men who had gone from Chiswick, as well as of the present staff, he had asked those present to meet him that he might formally wish them good-bye. Subsequently—and quite unexpectedly—the staff presented Mr. BARRON with a handsome marble clock, through Mr. TURNER, the garden foreman, who spoke of the respect in which the Superintendent was held by the *employés*.

**REDUCED RAILWAY CHARGES FOR PRODUCTS.**—The London & South-Western Railway has followed rapidly on the lines of the Great Eastern Railway in establishing much cheaper rates for the transit of fruit, vegetables, and farm products to London from its numerous stations, the reduction being 33 per cent. within about 25 miles, to 20 per cent. for long distances. The rates include two classes, No. 1 and 2, the latter evidently comprising products of the more important or valuable kind, as in its case the reduction is slightly less. Thus 1 cwt. of products under class 1 can be sent from Ascot to London for 8*d.*, the previous charge having been 1*s.*, or from Romsey, Hants, for 1*s.*, whereas the older charge was 1*s.* 5*d.* In the case of products under class 2, the reduction is a trifle less. Although the railway company has for some time made known its intentions, and especially amongst farmers, in respect of feeding-stuffs, manures, &c., as well as of the marketing of poultry, &c., yet a very poor response, so far, has, we learn, been made on the part of agriculturists. One important thing to be borne in mind is that the newly-reduced rates apply to parcels of 1 cwt. and over. That condition may not benefit many consignors, unless they enter into combination to send their products to London as one consignment. To effect that, there is need for collecting and distributing agencies. These latter are to hand already in London but they do not exist in the country. It is for those who wish to benefit by the reduced rates to organise these useful agencies.

"THE FLORA OF BERKSHIRE" (dedicated by special permission to her most gracious Majesty the

FIG. 4.—FLOWERING SPECIMENS OF AGAVE AMERICANA.

(From a photograph sent by G. Friend, Esq., Northdown House, Margate.)

not been slow to jump on the market, and as a result it is not at all impossible prices have opened directly on the bottom of the scale. The generally bountiful crop of Potatoes for 1895, the world over, must be recognised, however, in deciding whether to sell or hold, also the fact of usual shrinkage in merchantable Potatoes through storing them, instead of selling direct from the fields.

**AGAVE AMERICANA.**—The Agaves figured in our illustration (fig. 4), flowered in the gardens of G. FRIEND, Esq., Northdown, Margate. As will be seen, they were handsome specimens, about 26 feet high, and attracted much attention. It was a kind thought of Mr. FRIEND to allow the public

Fellows of the Society. Mr. W. B. Hemsley exhibited specimens and photographs of Cactæ from the Galapagos Islands, and gave an account of some of the more remarkable species. Mr. R. A. Rolfe gave an abstract of a paper entitled "A Revision of the genus Vanilla," in which some fifty species were enumerated, seventeen of which were new, though five of them had been previously confused with older forms. The plants in this genus were described as tall forest climbers, some of them leafless; found almost throughout the tropics, though generally somewhat local in their distribution. Of the species described, 29 were American, 11 Asiatic, and 10 African. Six of the American species have aromatic fruits, and three of them are well known in commerce, although only one of them, *Vanilla planifolia* (often confused with other species), is largely cultivated as

**QUEEN.**—As no general Flora of Berkshire has been written, the author (G. CLARIDGE DRUCE, Hon. M.A. Oxon), since the publication of his *Flora of Oxfordshire*, has devoted a considerable portion of his leisure time to the compilation of the *Flora of Berkshire*. The work, which will extend to a volume of about 500 pages, is intended to be not only a catalogue, but a history of the plants of the county. The various botanical writers since 1550 have been pretty exhaustively consulted, and no pains have been spared in personally visiting nearly every parish in the county in order to make the work as complete as possible. In the *Flora* about a thousand flowering plants and Ferns will be enumerated, in addition to a large number of varieties and plants of casual occurrence. In order to show their distribution through the county more completely, Berkshire has been divided into five botanical districts, which are based upon the river drainage. The plant distribution through these, and also through the border counties, will be shown in a tabular form. Brief sketches of the topography, the meteorology, the geology, river drainage, and the physiography of the botanical districts will be given. The work will also include short biographies of the various botanists who have investigated the Berkshire botany.

**HOP CULTURE.**—Judging by the statements recently made by a deputation that waited on the Prime Minister, Hop culture seems to be in a bad way. But Hope after all are not the only things that are cheap. No doubt a very much larger area of land in this country under Potato culture than is under Hop culture, yet Potatoes whilst having to encounter at this season no foreign competition, were never cheaper than now. Potato growers, however, do not invite help from the Government. Probably, after reading Lord SALISBURY'S cold-water reply to the Hop deputation, there will be no similar ones in favour of any other industry. Everything must be left to economic effects. Even fruit growing is found satisfactory only in certain cases, but higher prices would be more pleasant. Practically, growers suffer either from there being too abundant crops or because the public are not so great consumers as they should be. Perhaps in a year or two the tendency will be upward so far as prices are concerned and downward in production, and then again we shall be no better off.

**PEOPLE'S PALACE EXHIBITION.**—The programme of a great exhibition to be held in June in the People's Palace, Mile End Road, has been issued. The committee is an influential one, and a substantial Guarantee Fund has been raised. There are twenty-seven classes, that devoted to horticulture comprising hot-houses, boilers and heating apparatus, lawnmowers, tools, pots, and plant boxes. There will be special sections for the display of work of (1), by individual craftsmen; (2), by apprentices and students of the various Polytechnic Institutions; (3), by women. Mr. LLOYD has been appointed manager of the exhibition. The honorary secretaries are HAROLD BOULTON, Esq., and ERNEST FLOWER, Esq., M.P.

**"THE MONEY-LENDER'S CLUTCHES."**—This little pamphlet professes to be an exposure of the manners and customs of some advertising money-lenders. If only a tenth part of what is here set down be capable of verification, there is still reason to demand Government inquiry, with a view to checking the iniquities here spoken of. The pamphlet is published at one penny, by the Yeoman Company, at 11, Palace Chambers, Bridge Street, Westminster. Provincial and other newspapers might do much by declining to insert advertisements, the character of which is generally obvious.

**THE HORTICULTURAL SCHOOL AT WAGENINGEN.**—We are informed that Dr. J. TH. CATTIE, for many years Editor of the *Nederlandsche Tuinbouwblad*, has been appointed Director of the newly-established School of Horticulture at Wageningen.

**SOUTHPORT CORPORATION PARKS.**—Mr. J. HARRAWAY, gardener to the Earl of Lathom, has

been chosen the successor to the late Mr. H. HALEWOOD, as Southport Corporation head gardener and parks keeper.

**SUBTERRANEAN FASCIATION IN TARRAGON.**—Mr. PHILIP FRY sends us a curious fan-shaped, lobulated growth, looking like a saddle-flap fungus, such as is often met with in decaying trees. The presence of scattered leaf-scales, however, shows that the growth in question is an undergrowth shoot fasciated in the manner often met with in Asparagus. Along the free edges of the fan-shaped lobes is a row of little pearly growing-points. These are the tips of the young shoots, but instead of separating as shoots generally do to form branches, they remain united by connecting cellular tissue. To what circumstances the disproportionate growth is due is not known, probably to some local excess of nutrition.

**FOREST GATE AND STRATFORD AMATEUR CHRYSANTHEMUM SOCIETY.**—Few of special floral societies are as active in the work of philanthropy as those concerned with the cultivation of the Chrysanthemum, which, in not a few cases, devote a part of their surplus funds to charitable purposes. The society which heads this paragraph has just made a donation of ten guineas to the local hospital—a proceeding well worthy of imitation. It may be remarked that this society is in a prosperous condition.

**ANNUAL REUNION OF MESSRS. DOBBIE & CO'S EMPLOYEES AT ROTHESAY.**—This annual gathering took place in the New Public Hall on the 27th ult., Mr. W. CUTBERTSON, the senior partner, presiding over a party of 120.

**THE PHARMACEUTICAL SOCIETY'S PROSECUTIONS.**—Before Sheriff FIFE, on December 16, THOMAS B. KERR, assistant to ALEXANDER CAOSS & SONS, seed merchants and chemical manufacturers, Hope Street, Glasgow, was charged with selling by retail a poison within the meaning of the Pharmacy Acts—to wit, a quantity of arsenic, forming an ingredient in a substance called "Ballykiennin Ant Destroyer"—he not being a registered pharmaceutical chemist. Mr. T. B. MORISON, Edinborough, said that the "Ant Destroyer," which contained a large quantity of arsenic, was spread upon twigs of bush, and might have resulted in most dangerous consequences to children. Mr. BORLAND contended that the prosecution was made only in the interests of pharmaceutical chemists, who wanted a monopoly of such sales. The Sheriff dismissed the case with an admonition, remarking that in this case the accused was the victim of "the letter which killeth."

**SHIRLEY AND DISTRICT GARDENERS' AND AMATEURS' MUTUAL IMPROVEMENT ASSOCIATION.**—The monthly meeting of this society was held at the Parish Room, Shirley, Southampton, the President, J. W. F. G. SPANGLER, C.C., in the chair. The number of members present was about forty. The committee offered two prizes for the best essays on "The Best and Most Economical Method of Heating a Greenhouse, Stove, and Pit, by Means of One Apparatus." And in response, two essays only were received; the committee awarded the first prize to Mr. J. L. MORRIS, The Gardens, Blightmont, Millbrook. The essayists read their papers at the meeting, and a discussion followed, especially in regard to the fuel, some gardeners advocating coke, and others anthracite coal. A vote of thanks was accorded the essayists at the close of the meeting.

**PRESENTATION.**—Mr. W. MCKELVIE, who some time since retired from the charge of the Duke of Roxburgh's gardens at Broxmouth Park, Dunbar, was entertained at supper on the 18th ult., on the occasion of his taking up the tenancy of Duncanlow Farm. There was a large gathering, and before the proceedings terminated Mr. W. MCKELVIE was made the recipient of a presentation marble clock, with ornaments, and bearing a suitable inscription.

Hearty wishes were expressed that the guest of the evening would be as successful in agriculture as he had been in horticulture.

**CHISWICK'S NEW SUPERINTENDENT.**—Before Mr. S. T. WRIGHT left his charge in Herefordshire, to take up the position of Superintendent of the Royal Horticultural Society's Gardens at Chiswick, occasion was taken by his many friends in that county to testify their personal esteem for him. Mr. WRIGHT was therefore entertained at dinner at the "Old Harp," Hereford, on Saturday afternoon, the 25th ult., when, in the presence of about thirty persons, he was presented with a magnificent marble timepiece, together with an artistically-executed address, in which the donors expressed their high regard for his merits, and their hearty wishes for his future welfare. Among the company, which was presided over by Mr. JOHN CRANSTON, formerly of the King's Acre Nurseries, were Mr. JOHN WATKINS, Pomona Farm Nurseries; Messrs. R. GRINDROD, Whitefield; F. HARRIS, Eastnor Castle Gardens; W. NASH, Bryngwyn; G. W. MEATS, Aylestone Hill; Chas. WHITING, of the Whitecross Nurseries; J. OUGH, Hon. Sec.; W. EARP, Guildford St. Nurseries, Hereford; J. WILLIAMS, Holmer Park Gardens; and others. Letters were also received from many who were unable to be present, including one from Mr. WRIGHT'S employer at Gleston Court (C. LEE CAMPBELL, Esq.), in which were many cordial testimonies to Mr. WRIGHT'S capabilities and genial disposition. In response to many laudatory speeches, Mr. WRIGHT returned thanks for the presentation, and acknowledged the kind feelings which had prompted them to invite him to take farewell of them under such pleasant circumstances. He was proud of the distinction that the Royal Horticultural Society had done him in appointing him to Chiswick, but the feeling was tinged with regret at taking leave of his friends and of the county. He had to succeed a most able man (Mr. BARRON), and he hoped to follow worthily in his footsteps, and to do credit to the Royal Horticultural Society and himself.

— In addition to the presentation referred to above, we have reason to know that Mr. WRIGHT was presented with a tea service by Mrs. Lee Campbell and daughter, a handsome clock by the *employés* at Gleston Court, and a reading-lamp from an *ex-foreman* at the same place.

"HEATING, AS APPLIED TO HORTICULTURAL BUILDINGS," was the title of a lecture given by Mr. H. CANNELL, Swanley, before the Chislehurst Gardeners' Association, on the 17th ult. The history of the subject, including the hot-bed system and the dangerous flue method, was exhaustively dealt with; and excellent hints upon the best system of boiler, and correct method of setting one, were given.

**NEW DIGNITARIES.**—It is desirable that the claims of all departments of knowledge and art should be recognised by the State, and this being so, the conferment of a peerage on Sir FREDERICK LEIGHTON, the President of the Royal Academy, is a matter for warm congratulation. It would in many respects, be better to institute a separate order of merit for intellectual eminence. To make such men a TENNYSON—for instance—a Lord, the same honour being conferred on a successful brewer or stockbroker, is grotesquely ridiculous. The eminent geologist, Prof. PRESTWICH, is to receive the honour of Knighthood.

**THE CHISWICK BOARD.**—We are informed that the Council of the Royal Horticultural Society has decided not to reappoint the Chiswick Board for the present year.

**THE POET LAUREATE.**—One of the most prominent characteristics of the late Poet Laureate was his sympathy with natural history, and the scientific development of the age. The newly-elected Laureate, Mr. ALFRED AUSTIN, has an equal feeling for Nature and for gardening, as witness his recent books.

**PROPOSED NEW PUBLIC PLEASURE-GROUND FOR ST. IVES, CORNWALL.**

The design which we reproduce in fig. 5, is the work of Mr. F. W. Meyer, the landscape gardener of the well-known firm of Messrs. R. Veitch & Son, Exeter. We have illustrated from time to time several of his plans, noteworthy those of Truro and Devonport Parks, from which that now given varies the absence of formality; this is due to the formation of the ground, and the number of masses of natural rocks and other irregular features which harmonise only with the irregular style of treatment.

The design was presented to the town of St. Ives by Mr. Edward Hair, jun.; and the land, together with a sum of money for seats, &c., were given by T. B. Blithe, M.P., of Trengwainton. Although the site covers but a few acres, it contains many

streamlets, which, at very little expense, will furnish irregular waterfalls, besides other desirable effects.

The native plants existing on the ground will be interfered with as little as possible. These consist mostly of Furze, *Ulex europæus*, Black Thorn, *Prunus spinosa*, Brambles, *Rubus fruticosus* and Bracken, *Pteris aquilina*, which here and there will be augmented by other species; large belts of trees and shrubs will be introduced only where it would be desirable to hide any unsightly object, such as the large water-reservoir and goods-shed, and other buildings of the railway company.

**BELGIUM.**

**SOME FINE ORCHIDS.**

THERE is now in bloom at l'Horticulture Internationale a *Catasetum Bangerothi* var. *giganteum* with an unusually large flower the lip measures

**KENTISH NUTS, COBS, AND FILBERTS.\***

This is an important crop as far as it affects the grower, and a few words may be useful from a salesman's point of view. I have no means of gauging the general crop from year to year, but it is very uncertain. The last three years' crops have been abnormal; such a fact as that of three consecutive years' crops being above the average is extraordinary. Beginning with the year 1893, 140 tons passed through our hands; in 1894, 120 tons; and this year we reckon there will be about 70, as against an average of 50 to 60 tons. I have for years been instilling into the minds of growers that the taste for stored Nuts has passed away—gone with the port-wine drinkers. The public now prefer the green fruit, and what is the result? Three blessings.

1st. The crop is extended over five months instead of three, thereby increasing the demand. We have

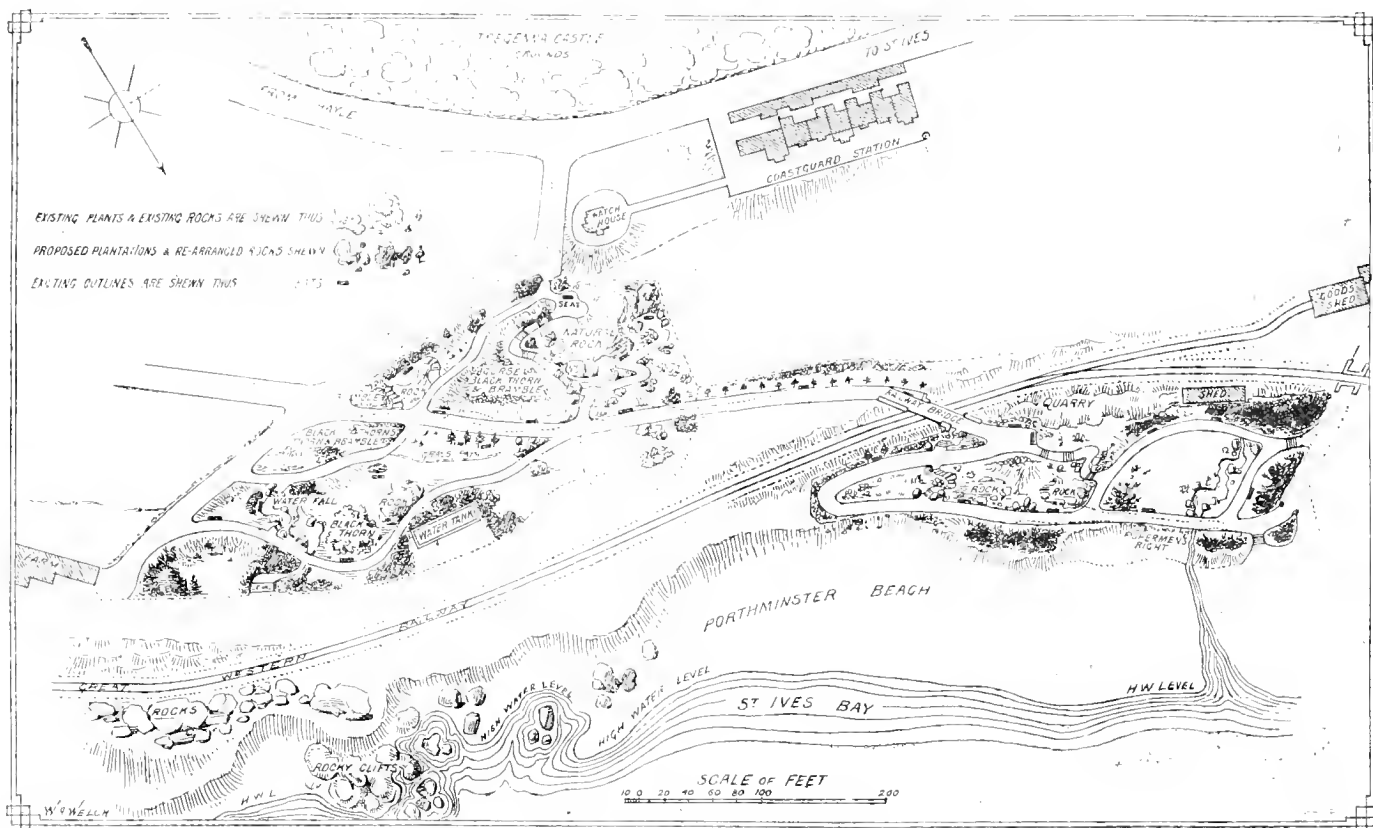

FIG. 5.—PLAN OF PLEASURE GROUNDS, ST. IVES, CORNWALL.

rugged natural beauties, to which the plan has been adapted in such a manner as to enhance them. Many of the large groups of granite are magnificent, and their huge proportions will be emphasised in some parts by means of rugged steps cut in their sides, and by zigzag paths of easy gradients carried over their steep sides. Where alterations in the present levels will have to be made, especially in places where an easy path can be obtained by means of falling ground (sanging level), it is proposed to carry out the work with granite boulders of various sizes, with weather-beaten mossy surfaces arranged in a natural manner so as to be undistinguishable from perfectly natural features. In some of the rocky recesses that command good views, seats will be placed. Amongst the views thus seen will be St. Ives Bay, and its rugged rocky shore-line and cliffs. The site possesses the advantage of two

nearly 3 inches in diameter and breadth, and the flower is very handsome. There are also a *Cattleya* × *Dominyana* var. *aurea*, with yellow sepals, the lip with a golden ground; *Odontoglossum Rossi majus*, with flowers 2½ inches in diameter; and *Vanda Hovea* (?) with twelve flowers, smaller than those of *V. savais*, the sepals and petals very clear yellow, rounded, bordered and spotted with brownish-red, the lip violet, lengthened and rounded—a very close truss. There is also an abundance of *Lælia præstans* blooming well, with large, well-coloured flowers.

**UNIVERSAL EXHIBITION AT BRUSSELS IN 1897.**

As President of the horticultural section of this exhibition, the Government have appointed Comte Oaw. de Kerchove de Denterghem; as "commissaire," Comte de Grunne; and as secretary, M. L. Lubbers. *Ch. D. B.*

August, September, October, November, and December, instead of the last three months, as formerly.

2nd. The weight comes down heavier. Green Nuts, by storing, lose one-seventh of their weight, or 14 lb. in every 100 lb.

3rd. The value is increased by these two means, for my books show that in 1893 (the heaviest year), a ton of Nuts, worth £27 10s. to £30 green, realised £35 when stored. In 1894 there was absolutely no difference from beginning to end of the season; the price kept very regular, but the grower threw away his weight, and lost the equivalent of value. In the present year the price now (in December) is less than it was in the early winter months; in fact, there is scarcely any demand. These results have been gained by three-quarters of the crop being marketed green.

\* Paper read by Mr. Webber, December 10, 1895.

What would have been the result to growers if the crop had been sent in the old way, viz., stored?

"To every ton of Nuts sold the last two months of the season, we should have had nearly 3½ tons on the market."

I leave it to you to judge the result to the grower. I think I have shown that the results for the past three years prove that the demand for stored Nuts is gradually falling away.

## HOME CORRESPONDENCE.

**GAME-COVERT PLANTING.**—Much has been written of late about this subject. I have not, however, seen a mention of three plants that are useful subjects to plant. They are Wood or Spurge Laurel, Butcher's Broom, and Periwinkle. All of these grow fairly fast under trees. The latter is especially vigorous. Fifteen years since I planted a wood with evergreen, Firs, Austrian, Corsican, and Scotch Pines, as well as Spruce. So thickly were they put in that I thought the Periwinkle would be quite killed, but no, now the bottom branches of the Firs are decaying, the ground is densely covered with the evergreen Periwinkle. This is useful, too, where hazel is grown, as the base of the stumps of the latter are soon covered, and afford shelter to game of all sorts. From seed the Wood Laurel grows rapidly, and being evergreen it should be useful. *E. M.*

**RE-ORGANISING THE ROYAL HORTICULTURAL SOCIETY.**—For some weeks past, various correspondents have given their opinion as to the future arrangements of the Royal Horticultural Society, some desiring branches in various parts of the country, assuming that if local branches were established, local talent would thereby be in touch with the Central Committee in London, and so rise to its proper level in the horticultural profession. The two letters in the *Gardeners' Chronicle* of last issue by "A Fellow" and "W. H. Divers," treating upon this subject, are worthy of much consideration by all horticulturists in the provinces. My own opinion is, that the Council of the Royal Horticultural Society should aim at maintaining its position as the authority in all matters of horticulture, and endeavour as far as possible to raise the provinces up to the highest level. Now, if at certain centres a Committee should be appointed and have the authority to award, say a First class Certificate, as from the Royal Horticultural Society, it is more than likely that the exhibit to which it was awarded would, if brought before the Committee in London, be passed over without notice, not, however, because the Committee is not honest to their brethren in the provinces, but because they are honest to horticulture. As a matter of fact, the members of the Committees at the centres are, and should be, the best judges, for two reasons, first, because if they are not men of talent, they would not be elected on the committee; and secondly, because they have constant opportunities of seeing the various degrees and shades of improvement, culture, and skill in the exhibits which are constantly brought before them. Therefore, if any award from the Royal Horticultural Society is to be of any value to its possessors, it should be confirmed, if not conferred, by the central authority. If various provincial committees once begun to make awards, as from the Royal, then there would be a general levelling down, and no true horticulturist could desire such a course. In honour of the committees who sit at the Drill Hall from time to time, be it said that they are worthy of all confidence. They have mine, certainly. Now, if there are some brighter stars dotted about in the provinces, so much the better for the local societies. Their light will shine the brighter and their influence must be the healthier for having them in their neighbourhood. If, then, any of our large societies will join hands with the Royal Horticultural in London, and send up some of their best men to sit on the committees, and pay their expenses if needed, all the provinces would be represented, and all the most capable men would make the awards, and the Royal Horticultural Society would gather strength and honour. Let the gardeners in the provinces become Fellows, and the societies become affiliated. But by all means keep the central society at the highest possible standard, and level up—not down. *N. Blandford, Moor Hill, Westend, Southampton.*

— It is to be hoped that the letters which are appearing in the horticultural journals at the

present time will be the means of bringing the Royal Horticultural Society, in some shape, into the provinces, and thus render it more truly national in its aims and movements. Its localisation in the metropolis, and metropolitan character of its membership, prevents its influence being felt in distant parts of the country. The difficulties of its doing this are serious; nevertheless, they ought to be met. An occasional move made from the centre to the extremities, so as better to gain the confidence of the horticultural community in the counties. But how, or in what direction shall the Society move? not in the form of shows, for these hitherto held have not proved successful, and doubtless they would not be more so in the future. I am old enough to remember what great things were expected when the Royal Horticultural Society first went to the country at Bury St. Edmunds, which if I rightly remember, was the only successful meeting they have ever held in the counties, a success mainly due to the laborious efforts made by your valued correspondent, Mr. D. T. Fish, and a few coadjutors. As the Society's show in country towns have not been visited by the many as was expected, we cannot blame it for not essaying another show at its own cost and on its own responsibility. I think, therefore, the committees of the larger country horticultural societies should now try what they can do. Suppose these bodies invited a deputation from the Royal to be sent to their shows accompanied by the secretary, and let the committees make it known through their schedules and by other means that the deputation from the Royal Horticultural Society will be in attendance on the first day of the show to award the Society's Medals, Certificates, and Cultural Commendations; those in possession of new, rare, or choice plants, flowers, fruit, or vegetables, and who might wish to exhibit them to the Royal Horticultural Society, would stage them on a separate table. If there is no class in the show for such exhibits to be adjudged according to the rules of the society, permission should be granted to the deputation to go over all the exhibits of the show, and make awards of a fitting character to whatever specimens of plants, flowers, fruits, or vegetables that are of exceptional merit. In the evening of the first day a paper might be read and discussed before the deputies. Something like the crude ideas above sketched out might be tried as an experiment, without any great expense being incurred to either society; and a connection having once been established, it could be strengthened in various directions. I would like to hear what other interested persons have to say to the above proposals. *J. Easter, Nottell Priory Gardens.*

**OPENING OF OENOTHERA FLOWERS.**—In reference to a note on p. 775 on this subject, I find from that wonderful work, *Index Kewensis*, that *Oenothera suaveolens* (D. et) is no other than the common Evening Primrose, *O. biennis* (Lin.). It is surely known to all observers of flowers that the flowers of this plant often expand on hot bright days suddenly, almost with a snap, about half an hour after sunset, and open as flat as a dinner-plate, far more flat than they appear the next morning, when they begin to contract. They always wither before night. I have been in the habit of taking my friends after dinner in summer to my *Oenothera* corner to witness this phenomenon, which I recommend to the attention of all who have never seen it. *C. Wolley Dod, Edge Hall, Malpas.*

— It may be of interest to note that the sudden opening of the flowers of *Oenothera* has not escaped the notice of at least one poet. In a volume of charming verse, *The Old Garden*, by Margaret Deland, charmingly illustrated by Mr. Walter Crane (1893), the following passage occurs in a description of an old New England garden:—

"Here, in warm darkness of a night in June,  
While rhythmic pulses of the factory's flame,  
Lighted with sudden flare of red the gloom,  
And deepened long black shadows, children came  
To watch the Primrose blow!

Silent they stood,  
Hand clasped in hand, in breathless hush around,  
And saw her shyly doff her soft green hood  
And blossom—with a silken burst of sound."

*Oenothera biennis* is such a weed that I am afraid its undoubted beauty of colour is often overlooked, but the name of *O. suaveolens* recalls two other little matters to me; first, how generally the generic name is mispronounced, it being forgotten that the "e" in the original Greek is long, and that; therefore the accent must be on that, the penultimate

syllable; and, second, that the fragrance of a South-American species forms the subject of a pleasing essay in Mr. W. H. Hudson's *Idle Days in Patagonia*, *G. S. Boulger, 18, Ladbroke Grove, W.*

**PEAR CATTILAC.**—I note the mention of this Pear, on p. 745 of the last volume of the *Gardeners' Chronicle*, as being well suited for growth as an espalier. I can vouch for its suitability as a bush-grown tree in the open. With us, trained in this manner, we never fail to get a full crop of fair-sized fruit of good quality. It is doubtful if there is another variety to equal this Pear in a culinary point of view. *E. M.*

**CYPRIPEDIUM BURTONI** ×.—My attention has been called by several people to the fact of *Cypridium Burtoni* being advertised for sale in the catalogue of a well-known firm. The true cross of *C. Burtoni* is between *C. Rebellini* and *C. barbatum Warneri*; and, with the exception of one plant exchanged with a friend, I have not yet parted with a single specimen to anyone, and there are very few altogether. *F. M. Burton, Highfield, Gainsborough.*

**ROOM FOR POTATOS.**—Mr. A. F. Pearson's reference to the greater crop of Potatoes furnished by outside rows of a breadth is but emphasising a well-established fact in all plant cultures, as well as in that of Potatoes. Plenty of light and air is essential, not merely to health, but to production. The important nature of the work that leafage has to perform in vegetation seems yet to be imperfectly understood by many who garden, and whose mistaken notions lead them still to assume that heaviest crops are obtained from dense planting rather than by thin planting, and thus permitting ample root and leaf development. Those who continue to plant Potatoes, especially strong growers, in rows at but 2 feet apart, have no conception of the harm they are doing to the leafage, the lungs literally of the plants, in so frequently crowding the tops that one-half the leaves are excluded from the influence of light, and largely from that of air. That is, of course, folly. What wonder is it if such their attenuated leafage not only plays no useful part in tuber production, but also, because so weakened and imperfectly developed, soon falls a prey to the attacks of the disease-sporae—those of the *Phytophthora infestans*. Where the soil is comparatively loose, these strong-growing varieties should be in rows fully 30 inches apart, and in stronger soil, 3 feet apart. Of course, in all cases the soil should be worked before planting correspondingly deep. Leafage also in the Potato helps materially in the manufacture of starch in the tubers, and the more fully it is bared to the light and air the more thoroughly is starch created. There are probably no directions in which we have so much harmed the Potato as by shameful bad storing of seed-tubers, and by too dense planting. *A. D.*

**COLGUR IN APPLES.**—On October 15 last, I sent an Apple to the Fruit Committee at the Drill Hall, describing it as a Blenheim Orange, giving also an account of my treatment of the soil during the past five years, and was awarded by them a Vote of Thanks. In the *Gardeners' Chronicle*, November 9, was a letter signed "D.," doubting the identity, and questioning the efficacy of my treatment. He closes his note by saying, "Perhaps Mr. Molyneux will solve the problem?" As Mr. M. has not yet called to see the Apple, and "D." may think I have let judgment go by default, I would beg a small space to inform him and your readers that my Apple is most unquestionably a Blenheim Orange. It is one of 5 bushels taken off the same tree, all well-coloured; and it is still in good condition in my fruit-room, and will be gladly shown to all who may favour me with a call. Having been engaged in fruit-growing from infancy, I hope it is not vanity to think that I could not mistake a *Mère de Ménage* for a Blenheim Orange. But after "D.'s" letter, lest I had erred, the Apple was shown at the Royal Horticultural Society's show at Southampton, and specially brought under the notice of the three judges, who were satisfied that it was rightly named. Afterwards it was staged at Winchester, and both Mr. Wright and Mr. Drover, the two judges, declared it true to name. I am sure "D." will accept the verdicts of the above practical gentlemen as final, with the assurance that nothing was further from my thoughts than to mislead in the slightest degree my brother gardeners. I would again repeat my firm belief in the application of soot, sulphate of iron, and potash (Kainit), as colouring agents in Apple cultures. This year I have used 300 bushels of soot to Wellingtons and Blenheims, and intend to add

the iron and potash in the spring. Mr. Molyneux would greatly oblige by giving his opinion of my trees and fruit when he saw them last autumn. I notice in the *Journal of Horticulture* that a gentleman in Yorkshire has been using the same fertilisers with a view to improve colour in the bleak North, and with success. It would be a boon to learn what he has to say on the subject. I know that in Sussex, Sarrey, and Kent there is good, ferruginous soil, where Apples will put on splendid colour without assistance. But where the essentials for this are wanting in the soil, why not assist nature by adding them as above? Would "D," kindly oblige me? When ripe, compare my fruit with his *Mère de Ménage*. Had he the two together at the same time? Or, after seeing one, did he go to look at the other? All *Mère de Ménage* grown hereabouts are heavier than Bleheims, and of quite a different shape. *Jno. Miles, Gardener, Portswood Park, Southampton.*

— Since writing my last, I have seen Mr. Molyneux's letter in the *Gardeners' Chronicle* on the above subject, and, with your leave, should like to correct one slight error, viz., pruning of Wellington (Damelow's Seedling). The trees are not closely pruned, but thinned out, and managed as freely-grown standards. The only other variety treated to the same way is the Ecklinville Seedling (Abbeyland's Pippin). All other varieties are, as Mr. Molyneux says, closely pruned. I am sending you a few samples of fruit of different varieties, taken from trees that have been treated as described, which, I think, will confirm all that I have said. The Blenheim Orange sent herewith was taken from the same tree as the one questioned by "D.," but not the same fruit, nor of so deep a colour. *Jno. Miles.* [We could not desire more finely-coloured, clean, and shapely fruits than those sent by our correspondents. The varieties were Cox's Orange, Fearn's, Blenheim orange and King of the Pippins, Bees Pool, Wellington, &c. The Blenheim, though highly coloured, was not of so deep a tint as the one exhibited at the Royal Horticultural Society. Ed.]

— I have to thank Mr. Molyneux for having so kindly enquired into the subject of the artificial coloration of Apples, by adding certain ingredients to the soil, and sought to be illustrated by Mr. Miles' sample of fruit of Blenheim Pippin previously referred to. I was led to believe that the one sample in question was *Mère-de-Ménage*, because, had it been placed in a dish of half-a-dozen of fruits of that variety shown at the Drill Hall at the same time, it would have been very possible to assert that it was identical with the rest. The fact that only one fruit was exhibited of this wonderful effect of artificial coloration also naturally led to some feeling of incredulity. If there be anything whatever in this assumption, that applications of sulphate of iron and soot tend to the production in Apples of exceptionally high colour, it seems odd that it should be just now have been discovered. As the Scientific Committee of the Royal Horticultural Society purposes dealing with the subject of the coloration of flowers and fruit, that body may also well take in hand this matter of the coloration of Apples, and experiment on a few trees at Chiswick, where there are such ample facilities. It is just possible that Mr. Miles' soil at Southampton is highly impregnated with iron, as there is a good deal of that mineral in certain strata in that locality, notably about Basset. The matter is one of too much general interest to be left in its present uncertain stage, and we may well hope to learn more facts later on. *A. D.*

**THE PHARMACEUTICAL SOCIETY** *versus* **THE NURSERY AND SEED TRADE.**—For some time I have been observing the doings of the above society and their widespread prosecutions of grocers and others who sell patent medicines. They are now prosecuting and endeavoring to prevent the nursery and seed trade from selling weed-killer and such insecticides as contain any poisonous ingredients. I consider the right to sell such articles belongs to them whose trade lies principally among gardeners and others who require and use these articles. We all know that poison sold by a chemist is just as dangerous as if sold by any one else. Neither will the Pharmaceutical Society convince us that it is in the interest of the public they undertake these prosecutions; it looks as though they were striving to obtain a monopoly for themselves, and I am astonished that the nursery and seed trade have quietly borne such petty tyranny as the society are using to deprive them of part of their

trade. They ought to combine to get petitions presented to parliament, drawing the attention of our legislators to the hardship of being prosecuted for selling articles they have hitherto been in the habit of selling, and that are no more dangerous when sold by them than when sold by a chemist, and let them agitate until they get the obnoxious 15th section of the Pharmacy Act deleted. *Stat Veritas.* [In the interest of the public some regulation is absolutely essential.—Ed.]

## PRICES OF GARDEN MANURES.

In your issue of December 14, your correspondent "Head" brings up a subject of considerable importance to horticulturists. The purchase of high-priced artificial manures in quantity, has to be carefully gone about with most gardeners, as a big bill may soon be run up, for which there may be a day of reckoning for the user, unless he can show that it was absolutely necessary. In my own practice, I have one of these well-known manures in frequent use for top-dressing, mixing with potting soils, Cucumber, Melon, or Tomato composts, and similar purposes where quick results are looked for. These manures are usually in a convenient form to use, and are sold as containing all the ingredients necessary for the growth of fruit and plants. I find they usually give good results, and for the purposes above mentioned, a moderate annual expenditure is sufficient. A good article is worth a good price, and I do not grudge the maker of a good manure, composed of the various ingredients necessary for plant-life, a fair profit on his special make of manure. For the making of new Vine and other fruit borders, however, the price is rather prohibitory. Most of these special manures are recommended by the makers to be added to composts, for new borders, at the rate of about 10s. worth of manure to the cubic yard. From several manure-dealers' lists before me, I observe the amount recommended varies from 8s. to 12s. per cubic yard, but 10s. may be taken as an average.

That there are great variations in soils goes without saying. Some soils contain naturally all the elements necessary for fruit and plant growth, others require more or less addition of manurial ingredients, while from some soils it is difficult to get good results, no matter what is added to it in the way of artificial manure. Manure dealers, as a rule, take no note of this, and recommend the same quantity to be added, whether the soil be good, middling, or bad. It is clear that what would be necessary in the case of a poor, or naturally infertile soil, would be, to a considerable extent, a waste of good things if applied in the same proportion to a soil naturally fertile. It is a well-known fact that over-manuring does not always increase the quantity of a crop, or improve its quality. This is, however, a matter of great importance to the cultivator. He has to get the best soil available in the circumstances for his purpose, and has to gauge as best he may, what additional ingredients are necessary to secure the best results. To add more than is required of expensive ingredients is a waste of money, which in the case of dealing with large quantities of soil would amount to a considerable sum. I have in my time helped to make a good many borders in large establishments, and for a considerable number of years have been from time to time making up fruit borders in gardens under my own charge, but in no case have I seen a soil used which required an expenditure for artificial manure equal to 10s. per cubic yard. In most cases, that sum would cover the cost of artificial manures, added to from 3 to 6 cubic yards of soil, according to its quality. While the results, with the necessary attention, and the usual annual top-dressing, were probably quite as good, as if a much greater expense had been incurred, in the addition of two or three times the quantity of manurial agents in the border. I believe for permanent borders, a rougher or coarser grade of manure should be used, as being likely to last longer, and not so liable to be washed out of the border by heavy waterings and the rain. Many gardeners I

have spoken to on this subject hold the same opinion. In connection with some new fruit houses, I had recently to make border space for 100 cubic yards of soil. It was decided to put in only half this quantity at once, in which to plant the Vines, the remainder being carted in when required by the Vines. The best soil available was the upper 3 inches of an old pasture, red fibry loam, perhaps a little poorer than I liked, but on that account not so liable to run too close together after the decay of the fibre as a heavier or richer soil. I added the usual proportions of broken brick, lime rubble, wood ashes, charcoal and soot—these cost us nothing, being produced on the estate or in the compost yard. The artificial manure consisted of equal parts of  $\frac{1}{2}$ -inch,  $\frac{1}{4}$ -inch bones, and bone-meal, a quantity of horn shavings, and some other ingredients. The cost for artificial manures worked out to about 2s. 6d. per cubic yard. So far as I could judge, the compost was all that could be wished for so far as manurial ingredients was concerned. The Vines made strong short-jointed growth, ripened well; they are in every way satisfactory, and have every appearance of giving good crops.

At the rate mentioned, the cost for artificial manures for the 100 cubic yards required, will be under £13. At the rate recommended by most manure-dealers, the cost of manure sufficient for the same quantity of compost would be about £50, being a difference of about £37, a sum sufficient to purchase all the top-dressing the border will require on a most liberal scale for a good many years to come. I do not pen the foregoing remarks with a view of disparaging any of the special manures in the market. As I have said before, I have one or other of them in frequent use for purposes where quick action is required, and find them most useful. My object is rather to point out:—

1st. That the proportions recommended to be added, in the case of new borders, means an expense few gardeners can incur in dealing with large quantities of soil.

2nd. That many gardeners hold, and act on, the opinion, that the bulk of the artificial manures added to composts for a permanent border should be of a coarser grade than that used for top-dressings and other purposes, where comparatively quick action is required.

3rd. That it would be to the advantage of manure-makers to introduce, at a fair profit, a manure of a coarser grade, for permanent borders, requiring a considerably less expenditure per cubic yard of compost.

4th. That it would not interfere with the sale of the present finer and higher-priced manures for special purposes; but that there is a good opening for such a manure, of a coarser grade, for fruit borders, for which there would be a considerable demand. *Sans Peur.*

## FRUIT SUPPLY OF COVENT GARDEN MARKET.\*

To commence with, I will state that it is quite impossible to get at exact figures in regard to the quantities of any one kind of fruit, or even of the whole, and I shall only give as far as I can a rough estimate. The market is supplied from many different sources, coming in at all times of the day and night; and although the authorities check goods that bear toll, a great proportion is brought in by yearly stand-holders who do not pay toll, and whose totals are not checked. I understand that the market authorities do not distinguish between fruit, vegetables, flowers, or roots in calculating tolls, so that even if I could give you the exact figures, the fruit would have to be an approximate quantity based on knowledge gained by observation. That an army of about 700 to 800 porters get a living in unloading and delivering produce, will give some idea of the quantities to be handled, besides another 150 on the average employed for foreign trade.

\* Paper read by Mr. Geo. Monro at the conversation of the Horticultural Club, on Tuesday, Dec. 10, 1885.

It is the general rule to employ a separate staff of porters to unload goods and carry in, so that those engaged in carrying out are not hindered. I employ a man at so much per score, according to the size of the package, who is responsible, and he has to employ sufficient hands to keep clearing vans as they arrive. The amount spent in this way can only be judged by the fact that the one I employ has often to draw from £20 to £30 weekly, representing 20,000 to 30,000 packages; of course a great proportion of this is not strictly fruit, but in my case would consist wholly of either fruit or hot-house produce, such as Cucumbers, Tomatoes, &c.

*Strawberries* are the first fruits of the season, and these commence in small quantities in February, and increase weekly until May, during which month I think I shall be quite within the mark in saying the daily supply averages nearly a ton, and keeps about the same during June, until the outdoors commence, when, of course, the supply from Hampshire, Essex, Middlesex, and Kent is enormous, although every year a greater proportion is sent direct to the country markets, whole train-loads being made up in Kent for the North. This also refers to all kinds of fruits, so that the quantity passing through Covent Garden by no means represents the whole crop, even around London. Strawberries particularly are also largely sold in other London markets, especially the Borough, where many Kent growers sell their own.

*Currants, Gooseberries,* and other soft fruits, at one time used all to come to the London markets, but year by year a greater proportion go direct to the North, and this last few years a great deal has been made into jam in the country without being put on the rail at all. This refers also to Strawberries and Raspberries.

The same may be said of stone fruits, especially Plums, and it certainly is much better to see the fruit while perfectly fresh than to give it an expensive ride for a day or two, and then let it go into the pot at the finish. If there were more jam factories in the fruit-growing districts, there would be less spoiled in wet or plentiful seasons.

*Apples and Pears* I will take next, and the quantity of each received varies yearly, especially the latter, and I suppose no growers are so dissatisfied with the state of trade as the growers of pears, and it is mainly their own fault. For I must repeat what I have often stated, that there is no fruit comes to our market, either home-grown or foreign, which has so little care taken with it as English Apples and Pears. While this is the case, growers must not wonder at fruiterers buying foreign articles whenever they can. But this is simply suicide, as the English Apples particularly are far better in quality than any foreign, and if sent in unchargeable boxes, well selected and graded, there would be a far more ready sale. I was in a large wholesale co-operative store in Manchester this autumn, where they had English and American Apples side by side; and on asking the quantity of each sold, was informed, about 1000 barrels (3000 bushels) American, against 100 bushels English; simply because the packing could not be depended upon. This is a point that must be taken into consideration by those planting Apples and Pears, if they want to hold their own against foreigners.

There seems this year a decided step in the right direction with English Apples; they are certainly much better on the whole. I think this is partly due to the season, and to the fact that the newer plantations of good fruit are coming into bearing, as well as the fact that only the best have paid to market.

The Great Eastern Railway are now finding boxes at a small charge to convey produce of any kind, so as to avoid the bother they always have with returned empties; and to induce growers and farmers to use them, are carrying goods packed in boxes at much lower rates of carriage. This is a step in the right direction, and should show growers the advantage of a non-returnable package; besides which, salesmen could sell for less commission, and customers would

give a higher price, as the expense and nuisance of empties are very considerable.

*Forced fruits* are of course received in increasing quantities each year, until what were at one time luxuries at fancy prices have become almost daily articles of commerce, especially Grapes, Tomatoes, and Cucumbers, and of these it is less difficult for me to judge the quantity grown.

Having already dealt with Strawberries, I will take—

*Peaches and Nectarines.*—These commence in small quantities in April, and keep on till November, the bulk coming from the beginning of June till the end of September, and by aid of a variety of sorts and different temperatures some growers will keep a daily supply during that time. Of course, this wants a great deal of management, as we all know what a change in the weather means to a Peach and Nectarine grower. This last year there were often 1000 boxes of Peaches and Nectarines on the market daily, and with the thermometer at 80°, and a close atmosphere, it is the most difficult trade to manage of any I come in contact with, as there are so few buyers compared with those of other fruits; but thanks to the energy of growers in keeping up a regular supply, the outlet year by year is widening. Growers need not fear foreign competition in these fruits, the French fruits being picked before they are ripe, being hard and small as a rule; and those coming from the Cape come in during January and February, the weather there being so hot that they cannot make the season last much over a month. The bulk of those received from there at present are Clingtones, the melting sorts not travelling well. The English Peach-growers may be assured that no foreign fruit of good quality can travel the distance and compete with them.

*Figs and Apricots* are still grown in very small quantities, the bulk of the former coming from the Channel Islands, from whence there are about 100 baskets, containing 4 to 6 dozen, daily through August and September, outdoor grown; and a good few forced ones, commencing in March.

*Melons* are still limited in supply, as they also are fancy fruit, and uncertain in price; but I daresay there are often 100 dozen daily from June to September.

*Grapes,* as you all know, have increased more than any other forced fruit, and I shall be well within the mark in estimating this year's crop of English, for market, at 1000 tons, of which about three-fourths pass through Covent Garden (besides Channel Islands and Belgium), the bulk being of late varieties, principally Alicante and Colmar, so that we have one year's crop on the market fully a month after the succeeding one has commenced, and in this way have made it very difficult to import Grapes at a profit.

From the Channel Islands I estimate that we receive quite 1000 tons, some 500 to 1000 tons being also distributed amongst the provincial markets.

From Belgium the supply, I should imagine, has reached about 200 tons, a much larger proportion coming to us during the last two or three years, owing to a prohibitive duty preventing them from going to the Paris market.

*Cucumbers* have also largely increased, the daily supply from March to the end of July being about 1500 flats, averaging 3 dozen each; and till the end of October about half the quantity, a large quantity during the hot weather being sold to go to Lancashire and Yorkshire, towns like Bradford and Leeds taking about 500 flats each weekly.

These last few years I have also opened up a large trade on the continent, especially with Germany, sending some days 300 to 400 dozen, and this trade shows signs of increasing, as fresh customers keep applying. At one time the bulk of our supply came from the continent, but our enterprising growers have in this instance turned the tables on them. This great increase has, in a great measure, been due to the care taken in grading and packing, as well as a suitable and uniform package being used. Apple-growers, take note.

*Tomatoes.*—In these, growers have surpassed themselves, and in a great many cases driven the foreigners from our markets, the supply from

March to November being enormous. I should think quite 2000 tons have passed through our market, house-grown, besides a very large quantity of outdoor ones, this being an exceptionally favourable year.

Large supplies also come from the Canary Islands, from December to April; but this fitting into the time when our home ones are off the market, does trade good by holding customers on to fresh Tomatoes until our next crop is ready.

There are also some French and Spanish, but smaller quantities year by year. I consider that the trade in these as well as in Cucumbers has been made by a regular supply of a good article, well and fairly packed.

As you all know, the acreage of glass-houses to obtain the supplies of the last three mentioned, viz., Grapes, Cucumbers, and Tomatoes, is very large, giving employment directly to thousands of hands, and indirectly helping a great many other trades, especially those connected with iron, glass, and wood, as well as the basket-makers. The firm who make most of mine keep thirty men all the year round on to my orders, besides which I use a good many made on the Continent. Go where you will, some people are earning something out of the trade; and I think it is becoming a most important national industry, and deserves the greatest encouragement both from Government and the railways.

*Foreign Fruits.*—These are an important element in our market and in the trade generally, as the continual supply from different parts of the world keeps many retail shops open which would be compelled to close if dependent solely on home-grown supplies, and in many kinds we are entirely dependent on them, as in the case of Oranges, Bananas, Lemons, and, of late years, Pine apples.

Since the Duke of Bedford opened the Floral hall adjoining the market for auction sales, the quantity of foreign produce coming to Covent Garden has very largely increased, and by bringing more buyers and concentrating the bulk of both foreign and English fruit our English trade has become stronger, as dealers can now get everything they want in one market. At the same time, there is so much of each kind coming, that many salesmen who used to sell both, have found it best to devote their attention to either one or the other; those going in for special lines generally succeeding better than other firms who attempt to dabble in everything, as was the custom years ago.

The foreign fruit and flower trade, in my early days, was regarded as a nuisance and hindrance by many market salesmen, but the provision made for it in the foreign fruit market has turned it into a blessing. We have converted a dangerous rival into a generous friend. It is useless to attempt to exclude from market, articles that the public require, and the producer can bring. The wider the basis, the more firm is the commercial edifice you build upon it. This is especially the case with such a subject as fruit, so liable to influence from climatic influence beyond our control.

*Oranges* are the most important of our imports, and come from every part of the world, wherever it is possible to grow them, commencing with Brazil, Jamaica, and Florida, and followed by Southern Europe, or the Mediterranean, also occasionally from India, and even Australia. The bulk of these arriving in the Thames used to be sold by the brokers in Pudding Lane, but every year a larger proportion comes to Covent Garden, especially the better class ones, such as Tangierines, Bloods, &c. Lemons also come to us in larger quantities every year, and they also keep coming from new countries such as Florida and Australia, and wherever they come from, whether Oranges or Lemons, and if only worth here about 2s. per bushel, every fruit is carefully wrapped in paper, so that if a certain portion get over-ripe, they do not affect the bulk so much as if they came in the way Apples are packed (save the word) in England. What would an English grower say if you asked him to wrap each Apple in paper when worth only 2s. per bushel.

The soft fruits coming from abroad commence with Strawberries, some very good ones coming from Honfleur in shallow handle-baskets, containing about 6 lb., some hundreds of baskets arriving daily in May. These are followed by red, white, and black Currants from France, which, as a rule, are very fine, and coming as they do before ours are ripe, they sell very well. Then come Cherries, commencing from Spain and the south of France, and working north as the season advances; in this way they make a long season, covering about two months, and there have been over 20,000 flats sold in one day about Whitautide. By being picked unripe to stand the journey, they are much inferior in quality to curr, and I think it is only because they come at a time when there is not much variety of fruit, as well as being very tastefully packed, that they sell.

It is when Greengages and Plums commence that the salesmen of foreign fruit get busy, as the enormous amount of those coming and the long time they cover is marvellous, an increasing quantity coming each year from Italy, so that from the time they commence, so far south, until Paris, the north of France, and Germany contribute their crops, a period of about three months is covered. And Gages are one of the fruits the foreigner can beat us at, owing to climatic advantages. As many as 10,000 to 15,000 flats are often sold daily, before our English ones are ripe. Apricots, too, thrive better abroad, and come in considerable quantities from southern France and Spain.

*Pine-apples* are now entirely a foreign fruit, as it is quite a novelty to see an English-grown one, and then only from private places. But they come in shiploads from the Azores, and although the price is much lower than it used to be, they still increase the quantity. At first they only attempted to send them while the Orange-boats were running, but of late years it pays them to run special steamers for Pines alone, the value of that crop being now much more than that of the Oranges grown there. The St. Michael Pine, too, have almost driven the old West Indian Pine from our market, as the second-class ones are sold as cheap or cheaper than the West Indian ones used to be.

Attempts have been made to send Pines from West Africa and Florida, and some coming in cool chambers arrived in good condition; but I think cool-chamber freight is at present too high to admit of it paying. No doubt Africa in time will be a great source of supply when it is opened up, but at present it is only such fruit as Grapes, and a few Peaches, Plums, and Apricots that are likely to pay the expense of cool chambers.

*Grapes* still come in large quantities from Spain and Portugal, but with the exception of Almerias, which keep for months in cork-dust, there are very few that pay to come, and I think the time is not far distant when the Almeria growers will have to turn their attention to something else. The only imported ones now finding favour are those coming from the Cape, and as these are principally black and white Muscats of fine quality, and also coming in March and April, when our home-grown ones are scarcest, they are acceptable as a good quality low-priced Grape.

*Pears* commence with those from France and Italy with such sorts as Jargonelle, Louise Bonne, and Williams', and up to two years ago our main supply was from there, but now cool-chambered ships and cool cars in trains bring such sorts as Williams, Beurré Hardy, and Doyenné du Comice by thousands of cases in perfect condition from California, and if it can be made to pay by reducing freight, the supply from there seems enormous, and will run the French very close as well as the English; but at present the freight of a case containing 40 lb. of fruit is over 4s., and unless temperature is very carefully regulated, they turn very quickly when exposed, and do not keep so long as the French. Some very fine Plums have also come from California in good condition.

California has a great advantage over England in regard to Pears which have to travel, and that is,

they seldom get rain while the fruit is ripening; and that, of course, is in favour of any fruit standing a journey, as well as the hotter climate ripening them more thoroughly. Eastern Beurrés coming in winter do not need cool chambers, and they fore come at a lower freight. A great many Peaches came from California last autumn, but were of very poor quality, being mostly cling-stones, and they were only fit for the barrow trade. In September this year there were weekly shipments received in our market of about 6000 cases of Pears and Peaches. At the present time the quantity is about 1000 weekly, principally Eastern Beurrés.

Perhaps, of all the imported fruits, Apples touch the English grower most, as they now come nearly all the year through, commencing in April with those from Tasmania, followed by those from France, Italy, and Germany, and all the winter from the United States, Canada, and Nova Scotia. But notwithstanding all these supplies, I maintain that our growers could hold their own if they would grow saleable sorts, and take the necessary trouble in packing.

From all reports, the Tasmanian growers cannot increase the quantity, as the freight and cost of case comes to about 4s., and by being so long in the cool chamber, they are not a patch on English for flavour. If larger quantities come, it will be impossible to get a remunerative price for them. American ones do not need the expense of cool chambers in transit; but to enable them to send all through the winter, they are compelled to keep them in expensively constructed warehouses, where an equal temperature is maintained, so as to protect them from heat, as well as frost, and so enable them to lengthen the period of sale as much as possible; and this, of course, adds greatly to the cost. Our climate, suiting Apples, as it does, should enable us, by adopting the right system of grading and packing, to hold the American fruit at bay till the bulk of our crop is sold, instead of this, growers seem to play with the trade all the autumn and winter, with the result that, in a full season, as many are wasted as marketed; while the foreigner, by growing saleable sorts, and putting a regular supply on the market, secures the bulk of the trade with an inferior article.

*Tropical Fruits* come in very small quantities, except Oranges and Bananas, the latter increasing in popularity each year; they come from Madeira and the Canary Islands principally, but attempts are continually being made to bring them in good condition from the West Indies, and even South America. Mangoes, Costard-apples, and Avocado Pears from Madeira; Lychee Nuts from China; and an annually increasing quantity of green Figs, Walnuts, and all kinds of Nuts from Spaito, Italy, Greece, and many other countries. To give an idea of the quantity of Bananas imported, there were received from the Canary Islands alone, at London and Liverpool during last month, 36,661 bunches, of which about 25,000 would be disposed of in Covent Garden.

Having touched briefly on our fruits and the sources whence they come, I think we must arrive at the following conclusions:—

1. That the English are becoming much larger fruit-eaters than they were, and this fact contributes largely to the decrease of drunkenness, amongst the lower classes especially.

2. That an attractive and suitable package is always a great assistance in establishing a trade, and that no trade can be made without a steady and constant supply.

3. That the demand having increased to such an extent, it now pays the growers to devote their time to fewer articles, and by giving their whole attention to them, they are more likely to succeed than by dabbling in everything. The grower who regularly sends the largest quantity of a good article, makes a large connection for his goods, and we can often sell out a large consignment to better advantage than a small one, though the quality of the latter may be equally good.

And lastly, the old parrot cry of doing away with the middleman, is, or should be, quite un-

heard, as any practical grower knows that it pays him best to devote his time at home, and to leave the selling to one who makes it his business. A very difficult business it often is, as it is often most ruinous to a trader to take advantage of an apparent scarcity, for we often find we gain a few shillings and perhaps check the trade and lose pounds in getting the customers on to them again. The distribution of fruit is a business in itself, but as the old cry still occasionally crops up in the Horticultural Press, I cannot resist a word in behalf of the importance of the "middleman."

## PENTILLIE CASTLE, SALTASH.

This fine estate, the seat of Colonel A. Coryton, round which so much of a most interesting character cling, and where the student of antiquities will find many objects that will excite curiosity, and raise pleasurable feelings, stands on rising ground, immediately on the banks of the Tamer. Though in reality in Cornwall, the view seen from the windows of the Castle is in the main that of Devonshire. These views are truly typical of that county—bold and broken, yet of a very charming character. At the edge of the horizon stretch the hills of Dartmoor, whilst immediately below the Castle the river winds in broad reaches, skirting the estate for a great distance, and rendered still more beautiful by having the bank clothed with trees and shrubs down to the water's edge. The estate is very extensive, and consists of a great many farms; still, that portion in the vicinity of the Castle is well wooded, a good deal undulated, and it seems at different times to have had much labour expended upon it in producing the fine effects now to be seen. The time at my disposal did not, however, allow me to wander over so much of the estate as I could have wished, and my rambles were confined chiefly to the glasshouse and the lawns and shrubberies, &c., close by. The houses are situated in a hollow of the ground, and are in consequence sheltered from the worst winds, a large belt of timber trees aiding in giving protection. Under the guidance of Mr. W. Johnson, the gardener, who has held the post for some eighteen months, the early Melon-house was visited, and a splendid crop of Tomatoes remarked, which had been sown in June, and planted to succeed the Melons. At the time of my visit, Nov. 11, the plants were covered with large and fine fruits, Volunteer and Satton's A1. On the shelf in this house there were good plants of seedling *Streptocarpus*, which are much esteemed by the owner. The house adjoining this one exhibited a nice lot of fruits of Tender-and-True and Lockie's Perfection Cucumbers on plants planted out in June, and which are still bearing nice fruit. Middling-sized plants of *Gardenia grandiflora*, healthy and vigorous, were on the back stage. Early and mid-season, and late vineries were visited, and in the latter I noticed a good crop of middling-sized bunches of Lady Downes seedling, Black Alicante, Gros Colmar, and Mrs. Pince. The Peach-houses were filled with Chrysanthemums and other plants. The trees were furnished with stout wood, having plump buds; the early house would soon be prepared for starting. In one of the vineries, a number of resting *Dendrobium* plants was noted, among them being large plants of *D. nobile*, *D. densiflorum*, *D. chryso-toxum*, and *D. thyrsoiflorum*, the new growths on the last-named being 2 feet long, stout, and shining. Other species were *D. Farmeri*, *D. Wardianum*, *D. heterocarpum*, *D. Findleyanum*, and *D. Devonianum*.

In the house exclusively devoted to Orchids, I noticed a plant of *D. Dalhousieanum* with splendid growths, 4 feet long, a pleasing sight, this not being one of the easiest to manage. A plant of *D. fimbriatum* possessed growths 4 to 5 feet in length. *Arpophyllum giganteum* was remarked with many sheaths of flowers, that will open in the spring; here, too, was noted a fine lot of *Calanthes*, with long flower-spikes, carrying numerous flowers, C.

Veitchii being the more abundant. *Cypripedium caudatum*, *C. Parishii* *Rozellii* were strong plants, as were many other varieties.

In the next house visited, many *Cattleyas*, *Lælia*, &c., were remarked, and amongst them plants of *C. Bowringiana* with several flower-spikes, bearing unusually dark-coloured flowers; *L. anceps*, showing well for bloom; *Peristeria elata*, stout, and giving much promise; *Lælia crispata*, *L. purpurata*, *L. cinnabarina*, with very stout short pseudo-bulbs; and many more in robust health. In this house were many large *Poinsettia pulcherrima* plants, and the roof at the back of the house was covered with an *Allamanda*, still carrying numerous blossoms. Here, too, is a plant of *Paeonia quadrangularis*, growing near the roof, and bearing fruit. These are less in size than those of *P. elata*, which we grow and fruit abundantly at Bystock, I was therefore the more pleased to see the fruit of *P. quadrangularis* at Pentlithie.

In the greenhouse flowering plants were staged of *Echynanthus splendens*, *Bonvardias* of great size, literally bushes; zonal *Pelargoniums*, *Marguerites*, *Daphne indica*, &c. In the front of the house a large number of *Marguerite Carnations*, in pots, full of flower and bud, the produce of seed sown last May in pans stood in cool frame, pricked out as soon as large enough to be handled, lifted from the open ground in September, and potted, and now they form one of the finest sights possible. The conservatory, which is gay with *Chrysanthemum*, has on the roof an immense *Bougainvillea glabra*, that was still beautiful at that time, and grand plants of *Luculia gratissima*, with such heads! Some splendid trusses of flowers from this plant were kindly sent for our inspection by Mr. Johnson. [See p. 650 of *Gardeners' Chronicle* for November 30, '95.] There are many other interesting subjects indoors, but I was obliged to view at least a portion of the grounds whilst light remained, visiting the Lime-tree avenue some 200 yards long—a very beautiful sight in high summer; the hardy fernery and rockery, in the latter hundreds of hardy species of *Cyclamen* in masses 2 to 3 feet across; the marbled foliage of these as they were embossed in their aged and decaying leaves formed a striking sight. Here were several *Dicksonia antarctica*, with stems 6 feet high; these plants are slightly protected in the winter, and no other protection is afforded.

In the American garden, which is a very extensive one, I remarked immense bushes of *Azalea indica* alba, which are at the very least 12 feet through, indicating a favourable climate and soil. *Kalmia*, *Andromeda*, large masses of *Rhododendron hybridum*, *Ghent Azalea*, *Azalea amœna*, and *Benthamia fragifera* 20 feet high, were noticeable objects. In parts of the ground stand many grand Beeches, whose pendent branches sweep the turf. Fine plants of *Camellia japonica*, *Myrtles*, *Bamboos*, *Yuccas*, and *Cannas*, were remarked; *Chimonanthus fragrans* filled the air with the delicious perfume of its flowers. Other remarkable plants were a *Chamerops excelæ*, 10 feet high; *Lapageria rosea* flowering freely on the walls of the mansion; whilst an arcade formed of *Enonymus japonicus* variegatus in variety, *Wistaria sinensis*, and *Roses*, must at certain seasons be a perfect bower of beauty.

Many other points of interest might be mentioned, including a visit to Mount Ararat, the burial place of Sir John Tilley, one of the ancestors of the family, around which lingers much of singular interest. These rambling notes, however, will give a faint idea of one of the old and still well-kept seats in the Duchy of Cornwall. *W. Swan, Bystock.*

## NURSERY NOTES.

MESSRS. W. BROWN & SON, ORMSKIRK.

In the division of Lancashire which forms the apex of a triangle, with Liverpool on the one base point and Southport on the other, there is a considerable area farmed on market-garden principles, some of the cleverer market-garden farmers doing

well because of the convenience to the great mart of Liverpool. In fact, in passing from one of Messrs. Brown's nursery quarters to another, it was pointed out that three crops had been taken off the field in the course of a season. First, a crop of Broccoli, and then early Cabbage was planted between the rows before cutting, which, with the protection of the Broccoli plants, served to shelter and carry through successfully a fine crop of Cabbages for early marketing, bringing highly remunerative prices—of course, because of the dire spring of 1895, which was so generally disastrous to every description of vegetable. Then, after that, came a crop of German Greens, which was yet to market. All this is only practicable through deep digging or ploughing and heavy manuring, and then there is a risk of a glut in the market, which tells against the receipts. It struck the writer forcibly that what is good land for marketing vegetables is good also for every description of nursery crop, and that the species of hangering which is practised for nursery work generally, not certainly in our best-managed nurseries, is neither a productive nor a paying one.

Most of the land in the nursery quarters, either owned or tenanted by Messrs. Brown, is of a peaty character, and is admirably suited for *Rhododendrons*, *Aucubas*, *Retinosporas*, *et hoc genus omne*, evergreen *Privet*, *Hollies*, and every description of fruit trees. A soil of a peaty kind requires frequent enrichment, and it appears to be well seen to in that respect in the various quarters. There are in the meantime about 46 acres under cropping, and the crops generally are highly satisfactory. The trade here is chiefly a wholesale one, and since its beginning, about thirty years ago, it has been a steadily-increasing one.

The ground seems particularly suitable for the growth of fruit trees. Apples are specially notable, as here they are to be seen growing for fruit alone, and for general market supply, from "maidens" onwards. The great run in the nursery is for Lord Grosvenor Apple, which is the best all-round one for eating and for a crop; then *Golden Spy*, *Maltater*, and *Scotch Bridget*, which seems to be a local one, resembling in character *Maltater*, which we have seen particularly good this season. This *Scotch Bridget* is more oblong than *Maltater*, and is good either for kitchen or dessert; *Grenadier* is also a desirable Apple, because it is a free bearer in this quarter; and there is one called *Gold Medal*, which is similar to *Surprise*, that takes well. *Pott's Seedling* and *Lord Suffield* are grown, but Mr. Brown says they are no use, getting cankered after twenty years. *Lord Grosvenor* never cankers, and it beats them both for general usefulness. *Ecliville* flowers freely, but does not set well.

Although Pears are grown in quantity, the one most in demand is the *Hessell*, because of its free-bearing quality, always taking the market and fetching a fair price. Plums are grown for market as trees, but these are not generally to be depended upon in this district to bring good crops. Gooseberries are very largely grown, and form one of the staple crops; *Whinham's Industry* has been a capital speculation, the firm having been early at work with this variety, and the climate suits the *Gooseberry* admirably. While some growers were waiting for a crop, this firm was making cuttings of everything that would grow, and for years the demand was fully as great as the supply of plants. *Lancaster Red*, *Crown Bob*, *Whitesmith*, *White Eagle*, are most in demand, and propagated and grown accordingly. *Warrington*, which was the favourite in the days of my youth, is scarcely asked for. There is a considerable stock of it here, and finely-formed youngsters they are. Among Raspberries, the chief one, not much known, is called *Beehive*. It is much larger and better, both in colour and in flavour, than *Faletaff*, *Carter's Prolific*, and the best of the known sorts.

*Hollies* grow well. Most in demand are the green ones, and none other than green are grown; there are a hundred green ordered for a dozen of variegated in a nursery. There are several forms of *Hodgins* which still take front rank, some of the nobles order, the black and white *Maderensis* which stands a

street of weather better than most; also a remarkable fine green, smooth almost in the leaf, lively in colour as *laurefolia* but with leaves twice the size. It is a novelty to me, but it is a good one and a rapid grower, all the better if it is "kifed." The great advantage, outside of towns particularly, is to get berried *Hollies*; now *Hodgins* will not berry, but this light green one does freely, and so do *Maderensis*, *laurifolia*, and some others of the *Aquilifolium* race—all the better however not far removed from the type.

There are quantities of *Rhododendrons* which find a suitable home in this peaty soil. The hybrid seedlings are notable, and out of which spring some highly ornamental forms. *Retinosporas*, particularly *plumosa aurea*, are grown in great quantities, and find a ready sale—they are so useful and ornamental in small pots for town and window decoration. *Retinospora squarrosa* does well, and it is one of the best Japanese *Conifers* for towns yet introduced. *Smoke* can scarcely discolour it from its normal leaf coloration. *Skimmia japonica* does well, and is one of the coming plants for town decoration on a much larger scale than we see it now. *Ivy*, particularly the Irish form, does uncommonly well, and is in large demand. One of the best small-leaved purple varieties was found here by a local botanist, *Thomas Williams*, of Bath Lodge, and at all times finds a ready sale.

*Evergreen Privet* (*Ligustrum ovalifolium*) is grown largely, and both climate and soil suits it admirably. This is one of the best plants in commerce, it is so useful for making a rapid-growing hedge, and for cover for game, as well as for ornament in the mixed shrubbery as bush plants. There is nothing in commerce in the hardy way that finds a ready sale. It has all but completely shot out the ordinary deciduous small-leaved forms, and to a certain extent the oblong evergreen forms. In some localities it loses its leaves only partially during winter, unless in such seasons of rigour like the late winter and spring of 1891-5. In ordinary winters it remains evergreen in favoured localities.

Another plant grown largely here is the *Aucuba*. It fairly revels in the soil, and a large trade is done in this chiefly in the smaller sizes of plants, which can be sent all over the country, railway carriage not afflicting the lighter bundles so much.

The few glass-houses are chiefly in use for growing indoor plants for the local trade, and for propagating some of the less hardy evergreens. The firm was making a determined attempt to propagate *Tree Ivies*, but hitherto without success. This *Ivy* has to be wrought generally, and consequently fire, labour, and housing must add to its price. It is undoubtedly one of the best ornamental plants we have for town gardens and town parks, and we would like to see more of it, because in good localities it is not only stylish as a plant, but berries freely. *Viator.*

## Obituary.

MRS. BANNISTER.—Friends of Mr. BANNISTER, gardener at Cote House, Westbury-on-Trym, will, we feel sure, sympathise with him in the great loss he has sustained in the death of his wife, at the age of fifty, after eight weeks of intense suffering. *Jas. Garaway & Co., Clifton, Bristol.*

READING GARDENERS' ASSOCIATION.—There was an unusually large attendance of members of this body at the last meeting of the early winter session, held on Dec. 30 last, to hear an address from Mr. A. DEAN, of Kington, on the work of the Sarrey County Council, in relation to horticultural instruction. The lecturer first referred to the origin of the Technical Education Grant, detailed the nature of the Sarrey work in the form of winter lectures, summer inspections of allotments and gardens, demonstrations, addresses at flower shows, vegetable trials, and not least, continuation or school-gardens, of which last year there were some 450, and these will soon be largely increased. Great regret was expressed that practically nothing in the direction was being done in Berkshire,

# THE GARDENERS' CHRONICLE

("THE TIMES OF HORTICULTURE")

A Weekly Illustrated Journal

(ESTABLISHED 1841)

Among the Correspondents & Contributors to recent Volumes the following, out of many Hundreds, may be named:—

**ALPINE PLANTS:—**

BALL, J., F.R.S., the late.  
CHURCHILL, G. C., Clifton, Bristol.  
CORREYON, H., Geneva.  
DEWAR, D., Glasgow.  
DOD, Rev. C. W., Malpas.  
JENKINS, E., Hampton.  
POTTER, F., York.

**AMATEUR GARDENING:—**

RADGER, E. W.  
BOYLE, Hon. Mrs., "E. V. E." ("Days and Hours in a Garden").  
BRIGHT, the late H. A. ("Notes from a Lancashire Garden").  
CLARKE, Col. Trevor.  
CORDEROY, Justin.  
ELLACOMBE, Rev. Canon.  
EWHANK, Rev. H., Ryde.  
FREMANTLE, A. B.  
GUMBLETON, W. E., Belgrove, Cork.  
SALTER, J. F.R.S.  
THOMSON, W., Teignmouth.  
WEIR, Harrison.  
WILSON, G. F.R.S., Weybridge.  
WILKS, Rev. W., Shirley.

**ARBORETUM, &c.:—**

ANNESLEY, the Earl of.  
ACLAND, Sir T., Bart.  
ACTON, T., Kilmacurragh.  
BAKER, W. R., Bayfordbury.  
CROUCHER, G., Ochtertyre, Crief.  
DUCIE, the Earl of.  
MACLEAY, the late Sir G.  
MEATH, the Earl of.  
NICHOLSON, G., Curator, Royal Gardens, Kew.  
POWERS-COURT, Viscount.  
RASHLEIGH, J., Menabilly.  
SARGENT, Prof., Arnold Arboretum Cambridge, U.S.A.  
SHANNON, the Earl of, the late.  
SMITH, T. A., Dorrien, Esq.  
STAIR, the Earl of.  
TREVELYAN, Sir W., Bart., the late.  
VAN VOLXEM, J., the late, Brussels.

**CHEMISTRY:—**

CHURCH, Prof., F.R.S.  
DEHERAIN, Prof., Paris.  
EYEL, Bernard.  
GILBERT, Sir J. H., F.R.S., Rothamsted.  
LAWES, Sir J. B., Rothamsted.  
MITCHELL, W. S.  
MULLER, Dr. Hugo, F.R.S.  
WARRINGTON, R., F.R.S.  
WILLIS, J. R., Rothamsted.

**DISEASES OF PLANTS:—**

ARTHUR, Prof., New York.  
BOS, Dr. Ritzema, Wageningen.  
COOKE, Dr. M., G.  
KLEBAN, Dr., Bremen.  
MAGNUS, Prof., Berlin.  
MASSEE, G., Kew.  
MURRAY, G., British Museum.  
PAGET, Sir James, F.R.S.  
PHILLIPS, W.  
PLOWRIGHT, Dr. C. B., King's Lynn.  
PRILLIEUX, Prof., Paris.  
SMITH, W. G.  
SORAUER, Prof., Proskau.  
WARD, Prof. Marshall.

**FERNS:—**

BAKER, J. G., Royal Gardens, Kew.  
BRURY, C. T., Forest Gate.  
HEMSLEY, A.  
JENMAN, British Guiana.  
LOWE, E. J., Chesham.

**FLORISTS' FLOWERS, &c.:—**

BEAN, R., Ealing.  
BODWELL, E. S., Oxford, the late.  
D'OMBRAIN, Rev. H. H., Westwell.  
DOUGLAS, J., Ilford.  
ENGLEHEART, Rev. G.  
HORNBER, Rev. F. D.  
KLEWELYN, Sir J. B., Bart.  
MOLYNEUX, E., Swanmore Gardens.  
PAUL, G., Paisley.  
TURNER, C., the late.

**FOREIGN CORRESPONDENCE:—**

ADLAM, R. W., Johannesburg.  
ALBOFF, Dr., Odessa.  
ANDERSSON, J., Sweden.  
ANDRE, E., Paris.  
BARON, E., New York.  
BENNETT, H., the late, M.D., Meotoue.  
BUDDÉ, J. K., Utrecht.

**FOREIGN CORRESPONDENCE:—**

CARRIERE, E., Paris.  
CARUEL, Prof., Florence.  
CORCORAN, Odessa.  
COSTERUS, Dr., Amsterdam.  
CLOS, Prof., Toulouse, [Brussels].  
CREPIN, Director, Botanic Garden, DAMMER, Dr. Udo, Berlin.  
DE BOSSCHERE, C., Antwerp, Belgium.  
DE CANDOLLE, Casimir, Geneva.  
DEVANSAYE, A. de la, Angers.  
DRUDE, Prof., Dresden.  
DUCHARTRE, Prof., the late, Paris.  
ENGLER, Prof., Berlin.  
ERNST, Dr., Caracacas.  
FORSTER, O., Scheibbs, Upper Austria.  
GLAZIOW, Dr., Rio Janeiro.  
GOODALE, Prof., Harvard University.  
GOEZE, Dr., Griefswald.  
HANBURY, Comm., Mentone.  
HANSEN, G., California College of Agriculture.  
HANSEN, Prof. Carl, Copenhagen.  
HENRIQUES, Prof., Coimbra.  
JOLY, C., Paris.  
KANITZ, Prof., Klausenburg.  
KERCHÖVE, Comte de, Gand.  
KOLB, Max, Munich.  
KRELAGE, E. H., Haarlem.  
LANGE, Prof., Copenhagen.  
LEHMANN, H., Popayun.  
LEMMON, J. G., Oakland, California.  
MACFARLANE, Prof., Philadelphia.  
MEEHAN, T., Philadelphia.  
MICHELL, M., Geneva.  
MONTIERO, Chev., Lisbon.  
MOTTET, H., Sceaux.  
NAUDIN, C., Antibes.  
NELSON, W., Johannesburg.  
OLIVEIRA, J. D., Oporto.  
ORTGIES, E., Zurich.  
OUDEMANS, Prof., Amsterdam.  
PENZIG, Prof., Geneva.  
PIROTTA, Prof., Rome.  
PYNART, E., Ghent.  
REGEL, E., the late.  
RODIGAS, E., Ghent.  
ROVELLI, Sig., Pallanza.  
ROZE, E., Paris.  
SOLMS, Prof., Count, Strasburg.  
SURINGAR, Prof., Leyden.  
TRELLISE, Prof., St. Louis.  
TROUBETZKOI, Prince, the late, (Eucalyptus).  
VAN TUBERGEN, C. G., Junr.  
VILMORIN, H. L. de, Paris.  
VILMORIN, Maurice de, Paris.  
WIGMAN, Bot. Garden, Buitenzorg.  
WILLKOMM, Prof., Prague.  
WITTMACK, Dr., Berlin.  
WOLKENSTEIN, P., Soorash, Russia.

**FORESTRY:—**

BRACE, C. J., Orleans.  
FORBES, A. C., Rowood, Wilts.  
FRANCE, C. S., Aberdeen.  
MAYR, Dr., Munich.  
MICHIE, C. Y., Cullen, Aberdeen.  
ROGERS, H., Plymouth.  
SCHLICH, Dr., Superintendent, Forest Department, Cooper's Hill.  
WEBSTER, A. B.

**FRUIT CULTURE:—**

BARRON, A. F., Chiswick.  
BLACKMORE, R. D., Teddington.  
BUNYARD, G., Maidstone, Kent.  
CHEAL, J., Crawley, Sussex.  
CRUMP, W., Madresfield Court.  
MARKHAM, H., Mereworth.  
RIVERS, T. F., Sawbridgeworth.  
ROUPELL, W., Harvey Lodge.  
TURTON, T., Maiden Erlegh.  
WILDSMITH, W., the late.  
WOODWARD, Geo., Barham Court.

**GARDEN BOTANY:—**

BAKER, J. G., F.R.S., Kew.  
BALFOUR, Prof., Edinburgh.  
BARBEY, W., Lausanne.  
BROWN, N. E., Herbarium, Kew.  
BURBIDGE, F. W., Botanic Gardens.  
CLARKE, Col. Trevor, (Dublin).  
CLARKE, C. B., Pres. Linn. Soc.  
CORNU, Prof. Max, Director of the Jardin des Plantes, Paris.  
DE CANDOLLE, A., the late, Geneva.  
DYER, W. T. T., Director, Royal Gardens, Kew.  
ELWES, H. J., Cirencester.  
FRANCHET, M., Paris.

**GARDEN BOTANY:—**

HEMSLEY, W. B., F.R.S., Kew.  
HOOKER, Sir J. D., K.C.S.I., late Director, Royal Gardens, Kew.  
JACKSON, J. K., Museum, Royal Gardens, Kew.  
LEICHTLIN, Max, Baden-Baden.  
LINDSAY, R., Royal Botanic Gardens, Edinburgh.  
MAXIMOWICZ, Dr., late, St. Petersburg.  
MOORE, F., Royal Gardens, Glasnevin.  
MORRIS, B., Assistant Director, Kew.  
NAUDIN, C., Antibes.  
OLIVER, Prof., F.R.S., Kew.  
STRICKLAND, Sir C., Bart.  
TODARO, Baron, Palermo, the late.  
WATSON, Sereno, Boston, U.S.A., the late.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Table with columns for DISTRICTS, TEMPERATURE (ACCUMULATED), RAINFALL, and BRIGHT SUN. Rows include district numbers and weather data for the week ending Dec 21.

Table with columns for DISTRICTS, TEMPERATURE (ACCUMULATED), RAINFALL, and BRIGHT SUN. Rows include district numbers and weather data for the week ending Dec 28.

The districts indicated by number in the first column are the following:— 0, Scotland, N. Principal Wheat producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Growing, &c. Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S. \* Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending December 28, is furnished from the Meteorological Office:—

"The weather continued very dull and gloomy over the Kingdom generally. Exceedingly heavy rain was experienced in the south-west of our islands, especially at Killarney, Roche's Point, and Falmouth, but in most other localities the falls of rain or sleet were slight and less frequent.

"The temperature slightly exceeded the mean in 'Scotland, W.', 'Ireland, S.', and the 'Channel Islands,' but was below it elsewhere; the deficit amounted to as much as 5° in the 'Midland Counties' and 'England, N.W.' The highest of the

maxima were recorded on the 28th, when they varied from 55° in the 'Channel Islands' and 'Ireland, S.', to 43° in 'England, N.E.', and 42° in 'Scotland, E.' The lowest of the minima were registered on the 22nd, and ranged from 18° in the 'Midland Counties,' 20° in 'England, N.E. and E.', and 21° in 'Ireland, S.', to 30° in 'Scotland, N.', and to 38° in the 'Channel Islands.'

"The rainfall was less than the mean over the northern and eastern parts of the Kingdom, but slightly exceeded it in 'England, S.', and 'Ireland, N.', while in the 'Channel Islands,' 'England, S.W.', and 'Ireland, S.', the excess was unusually large. The largest amounts for the week at any individual station were 5.80 inches at Roche's Point, 5.20 inches at Falmouth, and 4.63 inches at Killarney.

"The bright sunshine was almost entirely absent during the greater part of the period. The percentage of the possible amount of duration ranged from 6 in 'Scotland, N.', 'England, E. and S.' and the 'Channel Islands,' to 1 in the 'Midland Counties,' while in 'Scotland, E. and W.', and 'Ireland, N.' the amount recorded was less than 1 per cent."

MARKETS.

COVENT GARDEN, JANUARY 2.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. ED.]

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table listing prices for various plants in pots such as Adiantum, Aspidistra, Azalea, Chrysanthemums, Cyclamen, Dacrydium, Erica, Evergreen Shrubs, Ferns, Ficus elastica, etc.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table listing prices for cut flowers such as Arums, Azalea, Bouvardias, Carnations, Chrysanthemums, Eucharis, Gardenias, Hyacinths, Lilies, etc.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table listing prices for various fruits such as Apples, Grapes, Pears, etc.

VEGETABLES.—AVERAGE WHOLESALE PRICES.

Table listing prices for various vegetables such as Cauliflowers, Mushrooms, Cucumbers, Onions, Tomatoes, etc.

POTATOS.

Trade quiet; supplies heavy. Snowdrops, 70s. to 90s.; Hebrons, 75s. to 85s.; Bruces, 45s. to 60s.; Black lands, 30s. to 45s. J. B. Thomas.

SEEDS.

LONDON: January 1.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that, as might have been expected on New Year's Day, the attendance on the seed market was exceedingly restricted, and the business doing almost nil. It is noteworthy that as regards Clover and grass seeds, the striking absence during the past few months, of the customary autumn speculative dealings in these articles, will necessarily drive all the business therein into the approaching spring, thus making the demand, when it does come, a healthy, legitimate, and consumptive one. It may be added that the trade, when it does open, will find stocks all round fairly moderate, and prices for the most part unusually low. There is no quotable change this week in the value of either Blue Peas or Haricot Beans. Birdseeds are also held for former terms.

FRUITS AND VEGETABLES.

BOROUGH: Dec. 31.—Quotations:—Savoys, 3s. 6d. to 5s.; Cabbages, 3s. to 3s. 6d. per tally; Onions, 2s. 9d. to 3s. 6d. per bag; Horseradish, 1s. to 1s. 3d. per bundle; Apples, 4s. to 6s. per bushel; Chestnuts, 6s. to 10s. per bag.

SPITALFIELDS: Dec. 31.—Quotations:—Bunch Greens, 1s. to 1s. 6d. per dozen bunches; Savoys, 2s. 6d. to 3s. 6d. per tally; Sprouts, 2s. 6d. to 3s. per bushel; 1s. 6d. to 1s. 9d. per half sieve; Turnips, 30s. to £2 per ton; Carrots, 22s. 6d. to 30s. (best), do.; Turnips, bunch, 1s. 6d. to 2s. dozen bunches; Carrots, 2s. to 3s. 6d. do.; Beetroot, 1s. to 1s. 3d. per bushel; Parsnips, 6d. to 9d. per score; Leeks, 1s. per dozen; Apples, cooking, Deux Ans, 3s. to 3s. 6d. per bushel; Northern Greening, 2s. 9d. to 3s. 6d. do.; Wellingtons, 4s. to 4s. 6d. do.; dessert Apples, King Pippin, 5s. to 5s. 6d. do.; Blenheim, 4s. to 4s. 6d. do.; Queenings, 3s. 6d. to 4s. do.

STRATFORD, Dec. 31.—This has been a broken week, therefore the trade has only been fair. The supply has, however, been good at the undermentioned prices:—Collards, 1s. to 1s. 6d. per tally; Savoys, 2s. 6d. to 4s. do.; Greens, 1s. to 1s. 3d. per dozen; Cauliflowers, 2s. to 2s. 6d. do.; do., 7s. to 8s. per tally; Scotch Kale, 6d. to 9d. per sieve; Beetroot, 6d. to 8d. per dozen; Horseradish, 1s. to 1s. 2d. per bundle; Parsley, 1s. to 1s. 6d. per dozen bunches; Brussels Sprouts, 1s. 9d. to 2s. per half-sieve; do., 3s. 3d. to 3s. 6d. per bushel; Turnips, 1s. 6d. to 2s. per dozen bunches; do., 35s. to 40s. per ton; Carrots, household, 28s. to 30s. do.; do., cattle feeding, 17s. to 20s. do.; Parsnips, 6d. to 8d. per score; Mangels, 11s. to 16s. per ton; Swedes, 13s. to 17s. do.; Onions, English, 4s. 3d. to 4s. 9d. per cwt.; do., Dutch, 3s. per bag; do.; Bordeaux Port., 6s. 6d. to 7s. per case; Apples, English, cookers, 2s. to 3s. per bushel; do., American dessert, 2s. 6d. to 4s. per bushel; do., Nova Scotia, 12s. to 15s. per barrel.

FARRINGTON: Dec. 31.—Quotations:—Savoys, 4s. per tally; Cabbages, 2s. do.; Sprouts, 3s. per bushel; Leeks, 1s. 6d. per dozen; Cauliflowers, 5s. per tally; Celery, 13s. per dozen rounds; Turnips, 10s. per tally; Carrots, 2s. 6d. per dozen bunches; Parsnips, 2s. do.; Horseradish, 1s. 2d. per handle; Onions, bag, 3s. 9d.; Apples, Blenheim, 5s. per bushel; Canadian, 18s. per barrel; Ribston, 21s. do.; Newtown Pippin, 16s. do.; Greenings, 15s. 6d. do.; Stewing Pears, 8s. per cask; Tomatoes, 1s. 6d. per tray; Grapes, English, 1s. 6d. per pound

POTATOS.

BOROUGH: December 31.—Quotations ranged from 40s. to 90s. per ton.

SPITALFIELDS: December 31.—Quotations:—Sutton's Abundance, 55s. to 70s.; Main Crop, 50s. to 65s.; Bruces, 40s. to 60s.; Hebrons, 60s. to 80s.; Reading Giants, 50s. to 70s.; Druids, 55s. to 75s.; Snowdrops, 60s. to 80s. per ton.

STRATFORD, December 31.—Quotations:—Bruces, dark soil, 35s. to 40s., do., light, 40s. to 40s.; Reading Giants, 40s. to 50s.; Sutton's Abundance, 50s. to 65s. per ton.

LONDON AVERAGES: Dec. 31.—Dunbar Bruces, 50s. to 70s.; Saxons, 80s. to 100s.; Snowdrops, 60s. to 80s.; Hebrons, 60s. to 70s.; Imperators, 40s. to 50s.; Sutton's Abundance, 50s. to 70s.; Magnums, 35s. to 45s. per ton.

ADDRESS: W. B. The Tropical Agriculturist is published and printed by A. M. & J. Ferguson, at the Ceylon Observer office, Colombo. The price for small advertisements in the Tropical Agriculturist for twelve lines and under is per line of nine words, 9d.; above twelve lines, 8d.; and above twenty-four lines, 7d. London agents: John Haddon & Co., Bouverie House, Salisbury Square, Fleet Street, E.C.

BOOKS: Y. Y. Z. See answer to "J. P." and others, in our last issue.—Bookworm. Manures and their Application, by W. Dyke (Cate, Bouverie Street, E.C.) Special Manures for the Garden, by Dr. A.

B. Griffiths; Collingridge, Aldergate Street, E.C. The others may be obtained through any foreign bookseller.

CANE THAT SUPPLIES THE BOTTOMS OF CHAIRS, &c.: T. S. Calamus Rotary, C. rudetum, C. viminalis, &c., natives of Malacca and the Eastern Archipelago, and part of Eastern Asia.

CLEMATIS: J. J. The more commonly employed stock for grafting purposes is C. vitalba; although, possessing many plants of C. viticella, you might make use of those instead. Grafting is usually done on the top-end of small living pieces of the root, or in the case of small well-rooted plants in pots, on the stem, close down to the roots—tongue, whip, or bark methods will serve the purpose. Bind stock and scion together with worsted, using wax Le Homme Fort to smear the point of union, so as to keep out moisture. That part in root-pieces usually goes under the soil. Keep moderately close at a temperature between 50° and 55°, and guard against damp by occasional ventilation. Do not let the soil in which the stocks are get dry. A beginning may soon be made.

EMPLOYMENT IN THE LONDON PARKS: J. H. We know of no means of obtaining employment in the Parks, excepting by making a personal application to the Superintendents. There are no additions made to the various staffs before work becomes general in March and onwards, unless in the case of a man from any cause rendering a post vacant. Those obtaining casual employment receive, we believe, a guinea per week; and the regular hands rather higher wages, according to the nature of the employment. Your age is not against you being employed.

FOUR VARIETIES OF TOMATOS: W. G. Any of the "Perfection" strain, "Ham Green Favourite," "Chemin Rouge," "Challenger," "Duke of York."

INDIAN TEA GARDEN: A. Gardener. Advertise in some of the newspapers devoted to Indian commercial matters.

LARVENUM: D. P. The tree flowers like the Apple, on the one-year-old wood, and on spurs. Some slight amount of thinning of shoots where very numerous, and shortening back of leaders, would do good, and in the case of young trees, severe cutting till the basis of a good crown is formed. The less a tree is pruned afterward the better.

NAMES OF PLANTS: H. W. Reinwardtia trigyna (Litoum trigynum of gardens), one of the flax family—native of India.—J. S. A. We are unable to name the plant without the flower. Some weed introduced with foreign seed.

PEARS: H. Liverpool. Your Pear tree is evidently a seedling, and of very little value. The cracking of the fruit is most likely due to an over-supply of water at the roots, following dryness.

POLYGONUM SACHALINENSE: A. B. C. The plant is grown from sets or from seedlings, although the latter are not easily obtained true to name. The land should be deeply dug or ploughed, and abundantly manured. As the plant grows large, and carries a great deal of leafage and many stems, 2½ by 3 feet would not be too wide to plant.

VINES AND MEALY-BOG: Nurseryman. Having failed to eradicate the insect by the ordinary means which gardeners use, you should try Richard's XL All. It does not injure the most delicate plant, and is death to all kinds of insects. You might have to use it several times in a season.

COMMUNICATIONS RECEIVED.—A. Donaldson.—D. T. F.—R. (the paragraph has not been found).—A. P.—W. M., Perthshire.—H. W.—A. J. M.—J. D.—J. O'B.—G. A.—S. Longman & Co.—W. C. L.—H. W. W.—R. D.—E. W.—J. CONTINUED INCREASE in the CIRCULATION OF THE "GARDENERS' CHRONICLE."

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper, increased to the extent of more than 80 per cent., and that it continues to increase weekly.

Advertiser are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, and ALL CLASSES OF GARDENERS and GARDEN-LOVERS at home, that it has a specially large FOREIGN and COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

JOHNSON'S IMPROVED MUSHROOM SPAWN.

AND SIXPENCE FOR EVERY ADDITIONAL LINE.  
If set across two Columns, the lowest charge will be 20s.  
If set across three Columns the lowest charge will be 30s.  
Page, 4s; Half Page, 4s 10s.; Column, 4s.

**GARDENERS AND OTHERS WANTING SITUATIONS.** 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.  
Births, Deaths, and Marriages, 5s. each insertion.

**POSITION.**—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

**NOTICE TO ADVERTISERS.**—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

**POSTAL ORDERS.**—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to H. A. STRATTON, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

All Advertisements should be addressed to the PUBLISHER.  
Publishing Office and Office for Advertisements,  
41, WELLINGTON STREET, STRAND, W.C.

**SUBSCRIPTIONS.**

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, Great Queen Street, London, W.C., to H. A. STRATTON.

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

**ESTATE SALES.**

The Best County Medium for Advertising Sales of Estates

**THE "WORCESTER HERALD,"**

ESTABLISHED 1791.

The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other property advertised in the columns of the "HERALD."

**Sales of Stock and Agricultural Effects.**

The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcestershire.

**Farms to Let.**

Land Agents, Estate Managers, and all having Farms to Let, would do well to advertise in the "WORCESTER HERALD," the leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation. Moderate charge.

**Situations Vacant and Wanted.**

For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates.

Apply for Terms.

SPECIMEN FREE. Price 2d.

Published Friday for Saturday.

OFFICES:—72, HIGH STREET, WORCESTER.

**PUPIL.**—A youth just left school seeks employment as Pupil in the Floral Department of Nursery.—Address X. Y. Z., 47, Tavistock Street, Bedford.

**A HOUSE BUILT UPON THE SAND** cannot have a permanent foundation; and the same may be said of every undertaking in life. Success, to have a permanent effect, must be built upon something solid, or it will crumble into ashes when seemingly within our grasp. The foundation of anything of value must be carefully laid, or it will soon become useless. This remark is particularly applicable in reference to our health, for if it is not firmly established through the blood being pure and the stomach in regular order, we are liable at any time to be fatally attacked by disease. HOLLGWAY'S PILLS and OINTMENT lay a foundation of good health which will be permanent and strong as a rock.

**SELECT NOVELTIES IN FLOWER SEEDS FOR 1896, OFFERED BY HURST & SON, 152, HOUNDSDITCH, LONDON. SEED MERCHANTS.**

OUR COMPLETE LIST OF NOVELTIES WILL BE POSTED IN A FEW DAYS.

**WALLFLOWER RUBY GEM.**

This grand Novelty is certainly the most brilliant and effective variety of single Wallflower hitherto sent out. The colour is a beautiful clear shade of Ruby-Violet, with a bluish satin-like sheen (quite unlike the old purple Wallflower, which is more dark and dull in colour) and when seen in a mass the effect produced is very striking. It has the habit of the ordinary dark Blood Wallflower of medium height, and the flowers are extra large and of good substance.  
 A coloured illustration of this Novelty will be issued with our General Seed Catalogue for 1896.  
 Large Packets, retail, 1s.; Smaller Packets, retail, 8d.

**GRAND NEW CRIMSON**

**PERPETUAL-FLOWERING CARNATION, URIAH PIKE.**  
 (Grown by Mr. GEORGE MAY, Teddington, from whom we have bought the entire stock of seed grown this year, and now offer the same for the first time.)  
 Awarded Six First-class Certificates, besides the Silver-Gilt and Silver Medals of the R.H.S.  
 This is undoubtedly the GRANDEST CRIMSON CARNATION ever offered, at the same time the most decided acquisition to the Tree or Perpetual-flowering class that has ever been raised. In point of colour this noble Carnation reigns supreme, being a veritable GLOWING CRIMSON-VELVET SELF, and in this respect ABSOLUTELY UNIQUE.  
 Packets of 50 Seeds, retail, 2s. 6d. each; Packets of 25 Seeds, retail, 1s. 6d. each.

**SWEET PEA CUPID.**

We call special attention to the new dwarf SWEET PEA CUPID, a most unique Novelty of American origin, for which we have been appointed by the Vendors, MESSRS. ATLEE, BURPEE, AND CO., PHILADELPHIA, Sole Agents for the distribution to the Trade in Great Britain, the Australian Colonies, and India.  
 A brief Description of Cupid (the only dwarf Sweet Pea ever known).—The foliage is very dark green; blossoms pure wax-y-white, of unequalled substance, and fully as large as "Emily Handerson." The plant does not grow over 5 inches high, and never more than 12 to 15 inches in diameter. The stems are about 4 inches long, bearing two or three blossoms, all very near the end of the stem. It is a wonderfully free bloomer, and begins to flower as early as May and continues until November. The seed is white, and of usual size.  
 Packets of 20 Seeds, retail, 1s. each; Half-size Packets of 10 Seeds, retail, 8d. each. Electros, for use in Catalogue, supplied free on application.

**IMPORTANT NOVELTY OF LAST YEAR.**

**PRIMULA FIMBRIATA RUBRA SUPERBISSIMA.**

This grand new Primula may be described as the red counterpart of P. alba magnifica. The fringing of the extra large bold flowers—which are of great substance—is of the same heavy character as in P. alba magnifica, and which distinguishes that variety from all others; whilst the colour is that of the best type of the ordinary "rubra."  
 Per Packet, retail, 2s. 6d.; Larger size Packets, retail, 3s. 6d.

FOR PRICES TO THE TRADE, SEE OUR NOVELTY LIST.

**WHOLESALE SEED CATALOGUE.**

We have now published our Wholesale Catalogue of **VEGETABLE & FLOWER SEEDS** Containing also the best NOVELTIES of the SEASON, all the recent Improved varieties of Sweet Peas (60 in number) arranged in distinct shades of colour, and LIST of over 150 varieties of choice Fern spores. MAY BE HAD ON APPLICATION. Any of our customers not having received one by post will oblige by letting us know, when another shall at once be posted.

**BEST NEW LATE**

**CHRYSANTHEMUM, JANETTE SHEAHAN.**

This valuable variety received an Award of Merit and Silver Medal from the Royal Horticultural Society, and a First-class Certificate from the National Chrysanthemum Society, as a late-flowering variety.

In colour it is golden-yellow, slightly tinted bronze. Very dwarf habit. Plants only 2 feet high, in 8 and 10-inch pots, carry over 40 blooms. Strong Plants, in Spring, 2s. 6d. each; 3 for 6s.; 12 for 18s.

Price for large quantities on application.

My LIST OF NEW VARIETIES is Now Ready, and contains all the best kinds for 1896, post-free for One Stamp.

**NEARLY READY—THE CHRYSANTHEMUM ALBUM.**

By H. J. JONES,  
Containing THIRTY-SIX ILLUSTRATIONS of NEW CHRYSANTHEMUMS from photographs. Every grower should possess a copy, as this will enable him to select varieties from the actual representation of the flowers. This valuable work will be produced at great cost, and can be obtained of the Author, post free, 2s. 6d. each.

**H. J. JONES,**  
Ryecroft Nursery, LEWISHAM, S.E.

**NOVELTY FOR 1896.**

**Pure White, Large-Flowering, Single Chrysanthemum, "EWAN CAMERON."**

First-class Certificate, National Chrysanthemum Society, 1895.

An exceedingly dwarf-growing variety, only about 18 inches, and very bu-by; large pure white single flowers, which may be said to completely cover the plant; it is also invaluable for bouquets and other choice floral-work; grown in 5 or 6-inch pots, it makes a very nice table-plant.

Cuttings, 1s. each; Rooted Plants, 2s.  
Sent free by post. Cash only.

PRESS NOTICE.—Gardeners' Chronicle, Nov. 16, 1895.—"Certificate of Merit to E. C. GOBLE, for Ewan Cameron, a pure white, finely-formed single variety, of dwarf growth, and very free, the award being made to it as a highly promising market variety."

**E. C. GOBLE,**  
WALCOT NURSERY, RYDE, ISLE OF WIGHT.

**Williams**  
**STERLING NOVELTIES for 1896.**  
 Our own introduction—now offered for the first time.  
 Post Free.

**BEAN, DWARF FRENCH, WILLIAMS' EARLIEST OF ALL.**  
 This new variety is the earliest French Bean in cultivation. It can be forced a good deal earlier than any other variety. It is a splendid variety for pot culture as well as for outdoor work. It grows from 18 to 24 inches high, is a strong vigorous grower with a good constitution; the pods are long, broad, and fleshy, and of a green colour. They are very tender when cooked, and of excellent flavour.  
 Per packet (½ pint), 1s. 6d.

**TOMATO, "WARRIOR"**  
 This magnificent variety is a very free setter and good cropper, producing its fruits in great clusters. The fruit is large, round, and without ribs. The flesh is of a crimson colour, firm, with flavour of the finest quality. As the fruit is exceedingly symmetrical in shape, it will prove very valuable as an exhibition variety.  
 Per packet, 1s. 6d.

**NEW GIANT PRIMULA—PRIMULA SINENSIS FIMBRIATA "Magnum Bonum."**  
 This beautiful variety will form an excellent companion to the Giant White Primula, "Snowball," we sent out last year. We have every confidence in placing it before our Customers. The plants are very sturdy and compact in habit; the flower stem is strong, and rises well above the strong, robust foliage. The blooms are produced in great profusion, of a gigantic size, beautifully fringed, and the colour is a very beautiful shade of a rich deep red.  
 Per packet, 5s.

*For full descriptions of above see ILLUSTRATED SEED CATALOGUE for 1896, which will be forwarded, gratis and post-free, to all applicants.*

**B. S. WILLIAMS & SON,**  
 Nurserymen and Seedsmen to Her Majesty the Queen,  
 Victoria and Paradise Nurseries,  
 UPPER HOLLOWAY, LONDON, N.

**WEBBS' SEEDS**  
  
**WORDSLEY, STOURBRIDGE**

**Webbs' New Tomato: "REGINA."**  
 1s. 6d. and 2s. 6d. per packet, post-free.

This valuable novelty is early and very prolific; it sets its fruit well out-of-doors, and also under glass. The fruit is smooth, somewhat round in shape, of beautiful deep colour, and delicious flavour.

**WEBBS' SPRING CATALOGUE,** Beautifully Illustrated, post free, 1s. Gratis to Customers.

**VEITCH'S GENUINE FLOWER SEEDS, &c.**  
  
**PHYSALIS FRANCHETI.**  
 (First-class Certificate R.H.S., October 15, 1895).  
 A novelty of sterling merit, very striking in appearance, producing bright red fruits, 3 inches in length and from 7 to 8 inches in circumference. Very beautiful for Christmas Decoration when cut.  
 Per packet, 2s. 6d.

**CAMPANULA PYRAMIDALIS COMPACTA**  
 (Syon House Variety).  
 This variety is quite distinct from the older form, being of dwarfier pyramidal habit, with larger flowers and a deeper blue; very sturdy and free flowering.  
 Per packet, 1s. 6d.

**G. F. WILSON'S BLUE PRIMROSES**  
 (New).  
 Very beautiful and distinct. The flowers range from pale lavender to a deep violet. Per packet, 2s. 6d.

**TOMATO, ALL THE YEAR ROUND (NEW).**  
 First-class Certificate R.H.S., April 24, 1895.  
 Very superior variety, fruit bright red, of a plum shape, solid, and of high quality. Very prolific, producing clusters at every joint. Suitable for growing under glass, or in the open ground. Per packet, 2s. 6d.

*For full descriptions of the above and other choice Seeds see Catalogue for 1896, forwarded post-free on application.*

## THE **Gardeners' Chronicle.**

SATURDAY, JANUARY 11, 1896.

FALKLAND PARK, SOUTH  
 NORWOOD HILL.

**T**HIS, the residence of Thomas McMeeking, Esq., commands a beautiful site on the extreme southern termination of the Sydenham range of hills, the range on which the Crystal Palace stands. The views obtained from the mansion on a clear day are extensive in almost every direction. On the west lies the Thames Valley; Brentford waterworks tower is a conspicuous object; the pagoda in Kew Gardens can be picked out; Windsor Castle is readily seen, and the hills in Oxfordshire may be viewed on the horizon. Turning further south, we have Tooting and the Wimbledon valley before us, and a beautiful stretch of Surrey; as we turn further round, Epsom grand-stand is a conspicuous object, and nearer at hand is the borough of Croydon, further on Shirley Common, and over these are the hills above Oxted. Moving round, we look across South Norwood, Woodside, West Wickham, and in the distance Knockholt Beeches are a prominent feature. Next we come on Beckenham, Hayes Common, Keston Common and its ancient windmill can be seen, and a little further to the east are the spires of the Bromley churches, and one of the church spires of Chislehurst can be seen. Shooter's Hill, a prominent feature, shuts out a view of the Thames, and between it lie Penge, Anerley, and Sydenham, and past Shooter's Hill, a view into Essex. But here we are getting into the London smoke, and as we get looking across London it is only on a clear day now and then that Harrow-on-the-Hill can be discerned. A little to the right Stanmore, Bentley Priory, and Bushey Heath shut out the view in that direction. The historical interest that can be associated with the view here hurriedly sketched would require volumes to describe, and it is doubtful if many more views so extensive and interesting can be obtained in England.

Six years ago Mr. McMeekin bought this estate (of some 33 acres), then the residence of the twelfth Lord Falkland, a descendant of the late Admiral Lord Falkland, and extensive changes have taken place in that time. He has built a mansion on the most prominent part of the estate, and what was at one time a wood has been cleared away, and the grounds laid out according to modern ideas, with the object of opening up the surrounding scenery; the peeps through the trees at prominent points being very effective, lending to the view what we have been well told is enchantment, viz., distance—the ruling idea being a beautiful informality—an attempt to break away from mere stereotype, and an avoidance, wherever possible

of flat surfaces, the whole forming a charming undulating landscape. Mr. McMeekin is a keen and enthusiastic horticulturist, possessed with the laudable ambition of seeing gardening in its most modern aspects at his place, and being endowed with good taste, he has been successful in impressing his ideas on the gardeners. The old mansion lies lower down the slope, and had evidently been built for shelter from the north and east winds. The old entrance and carriage-drive have been done away with, and a new drive made to both the mansions.

#### THE CARRIAGE DRIVE.

The carriage-drive leading from the massive iron entrance-gates winds its way through some good specimen trees that have been left from the dense wood that covered this part of the ground. The background is shut in on one side by a shrubbery of choice flowering and foliage shrubs; on the other side the shrubbery is planted with dwarf-growing shrubs here and there, so as to obtain a view of the country beyond; on the left there is a piece of rock-work covered with alpine and herbaceous perennial plants, in front of which is a small piece of water, and behind this, and facing South Norwood Hill, is the gardener's dwelling. Beyond the pond, on a prominent position, stands a round tower, which was erected long ago, for the views to be obtained thence.

As we pass the tower we come on extensive grounds on the right sloping down towards the Oak wood in the distance, through which a view of the meadow beyond is obtained, backed up by a broad belt of trees, faced with Rhododendrons, to shut out the view of houses beyond. The specimen trees along the drive consist of one or two fine Oaks, green and purple Beech, Taxodium, Cedrus decedra, Weeping Ash, Chestnuts, Walnut, a fine Mulberry tree, evergreen Oak, Hollies; and on the turf between the shrubberies and drive, many of the choicer Conifers are planted, but it will be in years to come that these will be interesting, as they were only planted three years ago.

#### THE MANSION.

The mansion is a substantial-looking building of two stories, built of white Suffolk brick with stone facings. The west or garden front is the most imposing, and on this side we have the flower parterre surrounded by a low balustraded wall. The enclosure is laid out in a series of beds, some of which are planted permanently with dwarf-growing shrubs, others are devoted to the usual summer and spring bedding-plants. Towards the balustraded wall, single specimens of different species of Cupressus, Yews, Retinosporas, &c., are planted, and here stand in the summer-time some fine tubbed specimens of Sweet Bays. On the east side of the mansion is placed the conservatory, a building of a cruciform shape, with curved roof and lantern ventilators. It is entered by a short corridor from the morning-room, and reached by a short flight of steps leading down to it, and from which a fine view of the house is obtained. With the exception of the stages round the side of the house and over the hot-water pipes, the plants are arranged on the floor; and their arrangement is frequently altered so as to give as great a variety of aspect as possible. One of the wings is devoted to a fernery sunk 5 or 6 feet below the level of the floor, and built of Derbyshire stone by Messrs. Pulham; here some plants of Begonia Rex are growing very finely.

#### THE PLANT-HOUSES.

Leading from the parterre is a broad walk with shrub-beds on either side, which joins another at right angles leading to the plant-houses. The fine range, erected by Messrs. Mackenzie & Moncri, consists of seven large span-roofed houses connected by a corridor (see fig. 8), and at the back of the division-wall are placed the young gardeners' rooms, potting-shed, tool-shed, fruit-room, office, &c. As we enter from the walk mentioned, we come first to a house 60 feet

by 25 feet, devoted to flowering and foliage plants, with a fountain in the centre; and looking straight on we have the fine corridor 265 feet long, the back wall of which is covered with all the finer varieties of creepers suitable for this kind of work; and the rafters on the other side are also covered with climbing plants, and on the border on either side are arranged plants in pots in a bed covered with Tradescantia zebrina, and a row of Streptocarpus along the front. The plant-houses are filled to overflowing, and high culture, order, and cleanliness reign throughout.

Orchids are cultivated in large numbers; but the display was getting over at the time of my visit, although some good things were to be seen. Amongst them may be mentioned the true Dendrobium nobile album, Cypripedium in excellent variety, Aërides odoratum, A. o. Dayanum, A. Lobbi, A. Honlettianum, Odontoglossum Harryanum (fine varieties), Oncidium papilio (several different forms), the handsome Dendrobium Phalaenopsis Schroderianum, Cattleya Gaskelliana, C. Mendelli, C. Lowii, C. gigas, C. granuloza, Lælia grandis, Sobralia macrantha, Dendrobium infundibulum, &c. It should be mentioned that some specially fine varieties and hybrids of Dendrobium are being collected here, of which more will be heard in the future. The rockery-house, planted with Ferns and Begonias interspersed with cool Odontoglossums, Oncidiums, &c., is a charming retreat. In the early summer 250 Orchids were in full flower here, affording a very gay sight.

In the stove various fine plants were noted, viz., that splendid foliage plant, Cycasophyllum magnificum, not so often seen in gardens as formerly, being somewhat difficult to manage. The newish Leea amabilis attracted attention, as did Strobilanthes Dyeriana; the latter does best in the shade, bright sunshine "spotting" the foliage. Caladiums are largely and well grown, and in all the popular varieties. Anthurium Warocqueanum, and A. magnificum were represented by fine specimens in the midst of health. Adiantum fragrantissimum, a noble specimen, 4 ft. across, were noted; Davallia bipinnatifida as grown here is an admirable basket Fern; Musa Cavendishii, of stately proportions; finely-developed specimens were noted of Hoffmannia Ghiesbreghtiana, and H. variegata, not often seen so well done. A fine collection of Nepenthes in admirable condition and excellent variety (suspended from the roof), is grown. Allamanda Williamsii is considered to be the finest of all the Allamandas, with flowers sweetly-scented; Acalypha macrophylla was good; Monstera deliciosa was noted in flower and fruit; Begonia corallina, a good basket-plant. Tuberos-rooted Begonias were represented by good double and single-flowered varieties. Dipladenia Brearleyana, Clerodendron Balfourianum, and Medinilla magnifica deserve mention amongst flowering subjects; whilst the beautifully marked Bertolonia (amongst the foliage) were quite worthy of notice, because they are not coddled by being grown under bell-glasses—and grown thus naturally they present charmingly effective decorative objects. A very fine strain of Gloxinia is grown—the gardener's own selection here, a light blue flower, with white throat, was very effective. Datara coronopifolia, flowering from seed sown this spring, is worthy of a note—not often seen in private gardens. About seventy of the best varieties of Azalea indica are grown, quarter and half-specimen plants in a thriving condition. J. B.

(To be continued.)

## NEW OR NOTEWORTHY PLANTS.

### MASDEVALLIA × CURLEI

(MACRURA ♀, TOVARENSIS ♂.)

A LEAF and two flower-spikes of a most elegant Masdevallia raised by Alex. Curle, Esq., Priorwood, Melrose, N.B., between M. macrura and M. tovariana, disclose a worthy addition to the garden hybrid Masdevallias. The leaf very closely resembles that of M. macrura. It is, with the stalk, about

8 inches in length; the leaf-blede 5 inches long and 1½ inch broad, leathery in texture, of a dark green colour on the upper side, with four lighter green lines, and of a light green colour on the under-side. The scape is 10 inches high, pale green, not three-angled, as in M. tovariana, and bearing the one a single flower, and the other two flowers, the base of each having an inch-long whitish-green bract. The ovary is half an inch long, the tube half an inch; the upper sepal has a triangular base prolonged into a stout tail 4 inches long; the lower sepals connate for 1 inch of their length, their faces exhibiting three raised lines on each, then merging gradually into tails nearly as long as the upper one.

To the eye the elegant flowers are white, with a pale greenish or primrose hue on the tails, and the raised lines on the sepals, with a very slight blue-pink tint at the back of the flowers, and some minute purple dots on its face. One wonders why more of M. macrura is not seen, but if the flower is dissected and examined under a lens it gives ample evidence of its ancestry on that side, for the looked-for markings appear clearly, especially on the fleshy, ligulate lip, the bases of the narrow white petals, and the under-side of the column, all of which show beautiful purple spots and stripes. James O'Brien.

## ORCHID NOTES AND GLEANINGS.

### LÆLIA ANCEPS PROTHEROEANA.

SOME two or three years ago a small lot of a very distinct type of Lælia anceps was sent to Messrs. Protheroe & Morris for sale, the vendor giving the above varietal name in honour of Mr. W. H. Protheroe. Not always is a provisional name so happily given, for in this instance the plants have proved among the most brilliant and highly-coloured of any of the now large number of varieties. A three-flowered inflorescence, from Joseph Broome, Esq., Sunny Hill, L'Anodunoo (grower, Mr. Shill), represents one of the most marked and brightly coloured; the sepals and petals are white at the base, and the rest bright rose-purple, the petals being the darker, and exhibiting a flame-like purple-crimson flush on the outer halves. The lip is yellow at the base, with purple lines, the yellow running into a ridged orange streak, extending the rich crimson-purple front lobe. It may be regarded as the greatest improvement on the old L. a. Barkeriana. J. O'B.

### CYPRIPEDIUM BURTONI ×.

I appear to have made an error respecting the cross of this Orchid in the note I sent you last week. The cross of C. Burtoni is Lawrenceanum × Rebellini; and the cross, Rebellini × barbatum Warneri, which I have not yet shown, is named C. Monica. F. M. Burton, Highfield, Gainsborough.

## THE JERUSALEM ARTICHOKE.

I was much interested in the leading note, p. 648, vol. xviii., concerning the Globe Artichoke, and perhaps a few words on the Jerusalem variety may be equally reasonable and acceptable to others. It furnishes one of our best winter vegetables, and one which, I think, by careful selection or other means, might be much improved. The article I have already referred to stated that the improved variety then illustrated was grown by M. de Vilmorin, and to this gentleman we are also indebted for a superior form of Jerusalem or bulbous-rooted variety, greatly superior to others in shape, eating quality, and whiteness of skin or flesh. Of late years I have interested myself in the selection of the best roots only for planting of the old variety, and by such means I find that much better-shaped roots can be obtained, in which there is less waste. Other means of production I have not tried, but what can be done by selection in regard to vegetables is surprising, and the work is both interesting and profitable, as shapely roots are superior in quality, take up less room, and keep better.

The chief objections to the old common Artichoke

were its rough, uneven character, and its bad colour when cooked. The tuberous Artichoke contains so much more water than the Potato that many many persons do not like it; but I think the white are more solid than the purple form. I am not sure of this, however, as I do not know the analysis, nor yet if the more shapely roots have been analysed. The old form, though it contained a large percentage of water and less starch than the Potato, was little behind that popular tuber in regard to flesh-forming constituents.

The varieties of the Jerusalem Artichoke are few. I will only briefly refer to the old form, commonly known as the Purple, which, as I have previously stated, can be improved by selection, and by increased attention during growth. The root should be grown from shapely tubers, and only those with few eyes and of good shape saved for seed. Artichokes are frequently planted in out-of-the-way corners, and often much too close together. Give them more space, better soil, and an open position.

fer, like the larger tubers, may be improved by selection. It is well to select good seed, and give good land. Plant at least 2 feet apart between the rows, and in rich land the roots love moisture during growth. To obtain size, it is well to thin the shoots to a limited number when they push through the soil. All the varieties are best in the ground until required for use, and if they are dug up in the autumn, should be pitted like Potatos. *G. Wythes.*

MUSHROOM CULTURE.

As a forcible instance of what may be done on the small-holding system of land cultivation when intelligence, perseverance, and spirit are brought to bear on the work, it may not be uninteresting to the readers of the *Gardeners' Chronicle* if I attempt to give a brief account of the successful work of a gentleman in the important and difficult task of artificial Mushroom cultivation for market. In the secluded and pretty village of Walberton, situated in

June, and July of last year amounted to 16,959 lb. of Mushrooms, or a little over 7½ tons. In case it is supposed that this crop may have been procured from an unlimited area, I may mention that such was not the case, the area being limited, and the result being mainly attributable to the enormous masses of Mushrooms on the beds.

The view (fig. 6) gives a good idea of the nature of the crop. From 4 yards run of the bed, as seen partly exposed, 5 feet over, were gathered at one picking 72 lb. of Mushrooms, or over 1 lb. per square foot. This result, I imagine, has been very rarely equalled. On another occasion, a bed 90 feet in length and 5 feet over gave at one picking 210 lb., which must be considered a splendid result, seeing that, generally speaking, outdoor ridges continue to bear more or less for a period of three months, and sometimes very much longer. The other illustration (fig. 7) represents part of a morning's pick of 1298½ lb.

It may be stated that Mr. Hartley is no lover of indoor culture, believing that greatly heavier crops are obtainable from outdoor ridges than from sheds or houses of any kind or description whatever. He also appears to fully realise the necessity of employing an adequate staff of men to perform the work of bed-making, spawning, gathering, &c., quickly, so essential to an industry of this kind. Mr. Hartley has also numerous glasshouses for the growth of Tomatos, which he cultivates with great success.

This notice would not be complete were I not to mention that the above results in Mushroom-growing are being obtained from spawn of Mr. Hartley's own manufacture. He has given this part of the business much attention and study, and does a large trade in the sale of spawn at a reasonable rate. I have myself used this spawn for some years, and must say that I have invariably found it to be good. *J. Lourie.*

CHERRIES.

Much has been written within the past few years in favour of extended Apple and Pear planting, and a more careful selection of varieties. We must not, however, overlook the Cherry as a valuable fruit, which always commands a ready sale, and is profitable. Of course, we know that in many parts of the country the trees do not grow and fruit so freely as they do in some parts of Kent. It is only where they do succeed that I would advise more trees to be planted, and I feel sure that if this is done, the grower will have no reason for regret. As a preliminary to planting, the foremost consideration is the choice of a suitable situation and soil. The next important item is the selection of good varieties, which must not be numerous. The stock the trees are grafted upon should be free, and union perfect and free from gum. I think it need hardly be said that the best soil is that of medium texture; not too heavy, but rich enough to produce a free growth from the time they are first planted. Afterwards the roots must be fed to keep the trees in a fruitful state, when from heavy cropping they show signs of weakness. The land prior to planting should be thoroughly prepared, and the sub-soil well drained. A deep loamy soil in which the roots can strike out in each direction is required. Two years ago we planted six acres of land adjoining these gardens. The ground is somewhat high, and has a slope towards the north on the north and east sides; there is a good shelter of Chestnut trees, while on the west we planted a row of Damsons at 9 feet apart of the Farleigh variety to form a screen on that side. The ground too being well out of the valley, the flowers will undoubtedly better escape injury by late spring frosts. These trees stand at 40 feet apart with Plums halfway between, which will be grabbed out when the Cherry trees require further head-room. The varieties are Black Turkey Heart or Corone, a very heavy cropper; Rivers' Early, one of the best of Cherries for all purposes; Black Circassian, Kentish Bigarreau, Napoleon Bigarreau, and Elton; these latter four being of firm texture, and not injured by travel; Plums, Rivers' Prolific, The Czar, Belgian Purple; Cox's Emperor, Victoria, Gisbourne's, and Monarch.

FIG. 6.—GATHERING MUSHROOMS FROM AN OUTSIDE BED.

As these plants reproduce themselves so freely, the smallest root being sufficient to produce a plant, more than ordinary care is required when lifting them. Last season I grew Vilmorin's New White variety, and was much pleased with it. In regard to shape, size, and colour, it is a great advance, and these points are combined with good quality. Indeed, it is a valuable addition to our winter vegetables, but it requires plenty of space, and though not so tall as the old form, it is very strong, and branches in good soil. The tubers have fewer eyes, and are more like Potatos in shape, and the growth is more regular. Sutton's White is also much better than the old Purple, the tubers being smoother, and superior in quality. In my experience, it is not so large as Vilmorin's, which is no disadvantage, and it is a very heavy cropper. There will be little need to grow the old form now we have these superior varieties. Sutton's White, like the old Purple, makes a large top, and requires ample space, quite 2 feet between the rows, and 18 inches between each plant, or even more when it can be afforded them.

The Chinese Artichoke, *Crosnes*, or *Stachys tuberi-*

the south-western division of the county of Sussex, Mr. H. Hartley, absolutely without any previous or early training in any branch of horticulture, some few years ago began Mushroom-growing for market on outdoor ridges; and notwithstanding the serious drawbacks of having to procure most of his manure by rail from London, a distance of 70 miles, and that his Mushroom-grounds were situated some 3 miles from the nearest railway station, has deservedly succeeded in making the undertaking a conspicuous and financial success.

Mr. Hartley, since entering into business, has not been invariably successful in obtaining heavy crops of Mushrooms. He has had to contend—like most other growers—with occasional partial failures from causes difficult to trace; but instead of showing faint-heartedness and abandoning the work, as many have done under similar circumstances, he has kept steadily on his way, observing and noting each feature as it arose in the difficult and somewhat mysterious culture he had undertaken, until it would seem that the season of 1895 had brought him almost unparalleled success.

His gatherings for the months of April, May,

After planting, the land was sown with grass, to be kept closely grazed by sheep, so that no digging amongst the trees will ever be practised. In pruning the young trees the heads must be kept open, preserving from the first and second pruning about five young shoots at equal distances apart. These must be shortened more or less according to the strength of the growth. Having once obtained the shoots to form the main branches, very little pruning will be required, with the exception of shortening back the side-growths, and removing any shoots which are likely to cross each other. Braising at any time frequently leads to gumming and the loss of branches. Strong, stout stakes should also be used, and pads of straw when fastening them, to prevent rubbing during strong wind.

On walls, too, we find the Cherry one of the best of desert fruits, and if planted far enough apart to allow plenty of extension, and suitable varieties are selected, the season extends over a long period. Plenty of old lime or brick-mortar is good for mixing with heavy loam and well-decayed manure. Old Mushroom-beds make the best manure, as it induces mats of fibrous roots on walls. The Duke race should be planted a little nearer to each other than the large-leaved varieties, and the branches may be trained closer together, but a space of 30 feet is none too much for the Bigarreus. *H. Markham, Mere-worth Gardens.*

PLANTS IN FLOWER IN THE OPEN AT LA MORTOLA, NEW YEAR'S DAY, 1896.

The following list of plants in the Marquis Haubury's unique garden at La Mortola, which were carrying flowers on the first day of the present year, will be doubtless perused by many of our readers with much interest, showing, as it does, the wealth of floral beauty which a well-furnished garden in Italy affords at a season, which in our own land is all but flowerless as regards plants out-of-doors:—

- Abelia rupestris, Lindl.
- Aberia cafra, Haw.
- Abutilon Darwini, Hook.
- .. striatum, Dicks.
- .. venosum
- .. vexillatum, E. Morr.
- Acacia microbotrys, Benth.
- .. brachybotrys, Benth.
- .. obliqua, Cunn.
- Achyranthes argentea, Lam.
- Aeonium arboreum, W. & B.
- Echinanthus grandiflorus, G. Don.
- Agathaceae celestis, Cass.
- Agave filifera, S. Dyck
- .. sculymus, Karw.
- .. yne-efolia, D.C.
- Ageratum caelestinum, Sims.
- Albizia lophantha, Benth.
- Aloe arborescens, Mill.
- .. var. frutescens, S. Dyck
- .. aurantiaca, Bak
- .. cilifera, Haw.
- .. purpurascens, Haw.
- Schweinfurthi, Bak.
- Anagyris foetida, Lin.
- Anemone coronaria, Lin.
- Anthoeris littorea, Labell.
- .. viscosa, R. Br.
- Antholyza seducen
- Apongeton distachyum, Sims.
- Aralia Sieboldi, hort.
- .. papyracea, Hook.
- Arbutus Andrachne, Lin.
- Arctostaphylos arborescens, Jacq.
- Aristolochia sempervirens, Lin.
- Bambusa verticillata, R. Br.
- Banksia macrocarpa, R. Br.
- .. verticillata, R. Br.
- Begonia macrophylla, Dryand.
- .. Rex, Putz.
- .. fuchsoides, Hook.

BRITISH FERN VARIETIES, THEIR RARITY.

I HAVE naturally read with very much pleasure the communication of Mr. C. B. Green in your issue of December 21, as evidence that a thoroughly British fernery, as illustrated by you, meets the appreciation it merits as a collection of native plants, such as no other country in the world could furnish for the varietal point of view. This is saying a great deal, but it is not said rashly, as everyone who has looked into the matter and is capable of forming an opinion will readily admit. It is, however, unfortunate that your correspondent's quest for these varietal forms in their wild state should have been so entirely fruitless (especially when he names such likely hunting-grounds as South Dorset and North Wales), that he, apparently, has come to the conclusion that further search is useless. Let him not, however, lose faith, but try again, bearing in mind the curious fact, that these varieties are almost invariably solitary specimens of their class, though their individuality may be obscured by the crowd of common ones with which they are associated. To be successful, therefore, implies generally a careful plodding search among the multitude, keeping a sharp and indefatigable eye open for the tiny crests or other abnormality which may alone be visible, though the plant when extricated may be a well-developed specimen. I well recollect my first good find, when after a whole day's fruitless hunt on Exmoor, Blechnum Spicant concinnum, Drury, rewarded a last despairing scrutiny along an old stone dyke at Simonsbath. Every chink was crowded with small plants of various species, Lætare, Athyrium, and Blechnum; and in a clump of this latter species I perceived about an inch of what appeared to be a slender string of small green scallop shells. Pouncing breathlessly upon this, I traced the 6-inch frond to a centre from which radiated half-a-dozen others, all as true as a die to the type. A shout of triumph brought my companions to my side, and a "gem of first water," was the verdict. A short crowbar lifted the stone, the whole clump came neatly out, and in a few minutes the gem was disentangled from the crowd with roots intact, and installed in damp moss for its journey to London. One such experience is worth a ton of assurance, and if Mr. Green will only persist, I am sure he will alter his mind. Let him consider that two of our most noted hunters, Mr. J. Moly and the late lamented Dr. Wills, reside, or resided, in one of the very counties he has been unsuccessful in, viz., Dorset. Mr. Moly's own finds, i.e., the good ones, numbered years ago over 600, mostly discovered within his own locality; and Dr. Wills, not many miles distant, found a very large number in addition. Singularly enough, notwithstanding the keen eyes of both, two unique Ferns, Polystichum angulare Pateyii, and P. aculeatum pulcherrimum, were found close by their houses, the former by Mr. Patey, a visitor, and the latter by a labourer, who took it to Dr. Wills to see if there was anything in it. But Mr. Green will naturally say, these gentlemen were residents, and had daily opportunities which the limits of an ordinary vacation reduce a hundredfold. True! but leaving out of the question my own hunting experience, which now involve a fair number of good "finds" within such time limitations, I may cite that of my friend Mr. Barrard, who, without being a Fern specialist in any sense, called upon me one day with an album of fronds he had collected in his annual rambles. Among these were a number of

very good finds, one being actually the only known cristata form of *Lactrea rigida*, which unfortunately only exist as a memory, the plant having died. Stimulated by my expression of opinion, he found on his succeeding outing a very fine *P. ang. grandiceps* by the roadside, just out of Barnstable, and a pretty proliferous form of the same species. This was followed by a handsomely-crested Hart's-tongue, quite distinct, and that again by one of the neatest little crested *Blechnum* I have seen (found by his sister), a constant crested form of *P. vulgare*. In all these cases, I am told, the finds resulted not from the "plodding" search I have suggested, but by keeping a good look-out while walking along in likely places. Several of my own "finds" have cropped up in this manner, but obviously the element of luck comes in too much in these cases for me to alter the counsel I have given. A good deal, of course, depends upon whether the district is frequently searched. Perhaps Mr. Green has been

"souvenirs" a host of pleasant memories, of pleasant places, and, above all, of pleasant people whose "fellow-feeling" for a mutual hobby has made them "wondrous kind." *Chas. T. Drury, F.L.S.*

RECENT BOTANICAL DISCOVERIES IN NEW ZEALAND.

For botanical activity New Zealand stands in the front rank of our colonies, but it still wants a general descriptive account of its flora to succeed Sir Joseph Hooker's *Handbook* of thirty years ago. *Transactions and Proceedings of the New Zealand Institute* is the title of the organ of an incorporation of the principal learned societies of the islands; and it is in this that we find a record and description of the novelties brought to light by numerous explorers and investigators. This publication has now reached its twenty-seventh volume, and contains a number of communications interesting to botanists and horticulturists. Bot

where it is provisionally referred to the Boraginæ. New or old species of a very few Australian genera have been added; *Actinotus*, *Liparophyllum*, *Caleana*, and *Calochilus*, are interesting examples. The bulk of the new species belong to such well-known and widely-spread genera as *Ranunculus*, *Senecio*, *Veronica*, and *Carex*; and such characteristic Australasian genera as *Coprosma*, *Olearia*, *Carmichaelia*, *Celmisia*, and *Astelia*. I employ the term Australasian in the wider sense.

Returning to the last volume of the *Transactions*, the most attractive article is from the pen of the veteran, Rev. W. Colenso, F.R.S., who has spent sixty years in the islands, and who was lately the recipient of a testimonial, in the form of a portrait of himself, in recognition of his services to science in founding the Hawke's Bay Philosophical Institute. This article is entitled "Notes and Reminiscences of Early Crossings of the Romantically-situated Lake Waikaremoana, County of Hawke's Bay, of its Neighbouring Country, and of its Peculiar Botany; performed in the years 1811 and 1813."

Every line of this is good reading, and food for thought too; but it will not bear dismembering, and cannot be said to come within my heading of "Recent Botanical Discoveries."

Nearer the mark are Mr. A. Hamilton's *Notes on a Visit to Macquarie Island*. This is the most southerly of the islands in those waters, being about 510 miles south-west of Stewart Island, N.Z., and in no higher latitude than 54°, yet it is the limit of phanerogamic vegetation in this region, and a very sparse flora it has, away down in this stormy sea. Mr. Hamilton has added a few species to those previously known, including three grasses regarded as new. The total number of species is so small that I may give the list, as it will convey more than a brief description:—*Lanuncolus crassipes*, *Cardamine hirsuta* var. *corymbosa*, *Colobanthus muscoides*, *C. Billardieri*, *Stellaria decipiens*, *\*Stellaria media*, *\*Cerastium triviale*, *Montia fontana*, *Acena sanguisorbæ*, *A. adacendens*, *Callitriche antarctica*, *Tillæa moschata*, *Epilobium nummularifolium*, *E. linnæoides*, *Azorella Selago*, *Stilbocarpa polaris*, *Coprosma repens*, *Cotula plumosa*, *Pleurophyllum Hookerianum*, *Uncinia nervosa*, *Luzula crinita*, *Deschampsia Hookeri*, *D. penicillata*, *Poa foliosa*, *P. Hamiltoni*, *\*P. annua*, *Agrostis antarctica*, *Festuca contracta*, *Aspidium aculeatum* var. *vestitum*, *Polypodium australe*, *Lomaria alpina*, *Lycopodium Billardieri*.

This is a small flora for an island between 20 and 30 miles long, and 5 to 6 miles in its widest places. A quarter of an acre of ordinary meadow or heathland in this country would furnish more. But the bleakness of Macquarie Island is described as something that one must experience to fully realise; and then the immense number of penguins of various species are another scourge to vegetation. The foregoing list comprises three categories of plants. Those preceded by a star are certainly introduced—recently introduced—and possibly some others. The genuinely indigenous plants consist partly of species common to New Zealand and the extreme South of America, and the intermediate "antarctic" islands, including South Georgia, Kerguelen, and others, in the same latitude, and partly of such as are peculiar to the New Zealand region. Prominent among the latter are *Stilbocarpa polaris* (Araliaceæ) and *Pleurophyllum Hookerianum* (Compositæ); which are noble and handsome plants. The genus *Pleurophyllum* is confined to the small islands south of New Zealand, and the species are remarkable for their bold silvery foliage, and large bright purple flower-heads.

Our valued correspondent, Mr. Thomas Kirk, contributes monographs of the New Zealand species of *Gunnera*, *Gentiana*, and *Colobanthus*, besides descriptions of new species of various other genera. The genus *Gentiana* is almost as universally dispersed as *Ranunculus*, and it is more numerous in species, recent explorations in Western China having brought to light a very large number of exquisitely-beautiful forms. Most gardeners are familiar with the brilliant colours of some of the species; and on this point Mr. Kirk has put on record some curious obser-

FIG. 7.—MUSHROOMS: PART OF A MOB'S PICKING. (SEE P. 41.)

unfortunate in this respect. Obviously, notwithstanding the cases of Mr. Patey and the labourer above cited, one has little chance of success on ground which has repeatedly been gone over by an expert, and hence some out-of-the-way spot forms a better centre of operations than one on what may be considered a beaten track. Nature, however, it must be remembered, is constantly at work, and hence, wherever seedlings are numerous, there is always a chance of a "find." In short, the moral of all this is, "persevere," and if Mr. Green adopts it, I am sure he will alter the opinion he holds at present. Personally, I have never returned to London from a week or two's Fern hunting without bringing with me one or more boxes of varietal forms. Some of these, it is true, have proved inconstant and worthless, but a good number have fully justified the first feeling of elation they evoked when discovered. These naturally have been multiplied, either by spores or division, and by exchange have not only enriched my collection materially, but often on my visits to Fern-loving friends at a distance, greet me as old acquaintances, occupying the places of honour to which their beauty entitles them, and recall as

before giving an account of their contents, a few words respecting the progress of botanical discovery by the colonists themselves. For purposes of my own I have indexed the whole of the descriptions of reputed new flowering plants, published in the *Transactions*, and it is not a little surprising to find the number amounting to about 550, or very considerably more than half the number contained in Hooker's *Handbook*! This does not include the new Ferns, be it remembered. Whilst there is no doubt that a large proportion of these "new species" are really new and distinct, and the results of the exploration of previously-unvisited districts, there is also no doubt that a large number of them have by no means the same value as those of the *Handbook*, for instance. Considering that the new plants include the gatherings from large tracts and districts previously unexplored, it is surprising that only one new genus has been added to the flora of the islands. This is a small and inconspicuous plant, resembling a *Tillæa*, and yet of great botanical interest on account of its structure and obscure affinity. It has been named *Tetrachondra Hamiltoni*, and it is figured in Hooker's *Icones Plantarum*, t. 2250,

variations on the New Zealand species. He distinguishes ten species, and several varieties of two or three of them. Four of the species, namely, *G. saxosa*, *G. cerina*, *G. antipoda*, and *G. antarctica*, "are never found out of the reach of the sea spray," and the genus is represented in all the Antarctic Islands in the New Zealand region, except Macquarie Island. "All the New Zealand species primarily produce white flowers, although *G. antipoda*, *G. cerina*, and *G. antarctica* var. *imbricata*, exhibit also various shades of red, purple, and violet, or occasionally white, with vertical streaks of red; the other species are pure white, or rarely exhibit a pale lemon or sulphur tinge, which, however, never merges into a true yellow." So it seems there is neither a true blue nor a pure yellow among the southern species. Mr. Kirk brings the number of New Zealand *Gunneras* up to nine species. There are various other equally interesting communications, but this article is already long enough. *W. Botting Hemsley.*

## NOVELTIES OF 1895.

(Continued from p. 10.)

STOVE AND GREENHOUSE PLANTS. — These have been recruited in a general way, after the manner customary of late years, by additions in tuberous-rooted Begonias, from Mr. Thos. Ware, Mr. R. B. Davis of Yeovil, Messrs. H. Cannell & Sons, John Laing & Son, and others; *Caladiums* by Mr. John Laing and Mr. Peed; and the usual improvements in florists' flowers from all the best firms. Messrs. Jas. Veitch & Son, continuing their good work of improving popular plants, have sent out several superb *Hippeastrums* (*Amaryllis*), of which *H. Mrs. Montefiore*, the finest light variety yet raised; *H. Prince Edward*, dark crimson; *H. Dore*, a large and richly-coloured flower; and *H. Chimère*, a pretty red and white variety, are the best. Their new strain of *Streptocarpus* has *S. gratus* (Veitch's hybrid × *Duani*), which lasts in flower several months, and sometimes bears thirty flowers on a stem; their improvements in *Phyllocactus* culminate in *P. Excellent*, a gorgeous salmon-coloured flower; their new dwarf strain of *Caladium* has produced *C. Henry Irving* and *C. Lord Derby*; their perpetual and winter-flowering Begonias make distinct advances in *B. × carinata*, *B. Mrs. Heal*, and *B. Success*, the two last being showy crimson hybrids between *B. socotrana* and tuberous-rooted Begonias, and their fine flowers, produced in winter, are gains to gardens. Among the showier new greenhouse *Rhododendrons* is one of special interest, *R. Numa*, a complex hybrid, whose pedigree runs into five generations, and includes in its ancestors *R. jasminiflorum*, *R. javanicum*, *R. Brookeanum*, and *R. multicolor Curtii*; also, in the fourth generation, *Azalea indica* var. *Stella*.

Messrs. F. Sander & Co. have continued both the raising and importing of novelties with considerable success. At the Manchester show one of the great attractions consisted of their fine Begonias, of which the new strain of foliage and flowering pillar Begonias, entitled the Royal Set, received Certificates of Merit, and four new foliage Begonias, viz., *Lady Annesley*, *Sander's Masterpiece*, *Duchess of Sutherland*, and *Trentham Beauty*, were perhaps the most remarkable. The hybrid *Sonierias* and *Bertolonias* raised at St. Albans also show distinct advances, and among their imported Palms, Cycads, Ferns, *Alocasias*, &c., are many which, although known to botanists, will be acceptable novelties in gardens.

### FLORISTS' FLOWERS

still continue to be worked on as intelligently as ever by those who make specialties of the respective classes. In developing the Chinese *Primula*, a very remarkable instance of extremes is given by some of the noble new varieties of Messrs. Sutton & Son, and notably their Fern-leaved "Giant Rosy Queen," and Giant White, which may be regarded as two of the highest and most beautiful examples of the florist's art in producing large freely-coloured flowers, of fine form and substance on the one hand, and the

*Primula sinensis*, "The Lady," of Messrs. Cannell & Sons, Swanley, on the other, the latter being after almost an age of working and selecting, still in the main very close to the original *P. sinensis*, with its small elegant white flowers, which show up so well above the purple-tinted flower-stalks. In *Cyclamen persicum*, too, Messrs. Sutton & Sons have made remarkable strides, the Purple Queen and Salmon Queen being charming things, the constancy of which they have tolerably well fixed, so that they come true from seeds. How faithfully specialists stick to their specialties may be seen in the fine new *Clivia* model of Messrs. B. S. Williams & Sons, and *Clivia The Right Hon. Jos. Chamberlain* of Messrs. John Laing & Son, both of which are decided improvements in a class of plants which do not admit of much variety in colour, although the yellow and orange, as in these instances, have been still further advanced towards scarlet.

The *Chrysanthemums*, *Roses*, and other favorite flowers, have all been recruited by so many novelties that they demand special notice, for although but a portion of those advanced as novelties ever stand the test of time, still there are a large number of sterling good new varieties. The following novelties and rare plants have been illustrated in the *Gardeners' Chronicle* in 1895:—

*Eichynanthus Hildebrandi*, September 21, p. 333.  
*Anthericus villosa*, March 30, p. 591.  
*Begonia* × "Mrs. Heal," November 16, p. 585.  
*Begonia Fiebeli incomparabilis*, Dec. 7, p. 651.  
*Brachyglottis repanda*, June 15, p. 737.  
*Chlorocodon Whiteii*, August 31, p. 234.  
*Chrysanthemum M. Cheou Leché*, Dec. 7, p. 683.  
*Chrysanthemum* × *Princess May*, Sept. 14, p. 295.  
*Clematis Countess of Onslow*, May 25, p. 647.  
*Daisy*, "The Bride," August 3, p. 131.  
*Dautzia Lemoineii*, October 5, p. 398.  
*Dahlia* (*Cactus*), Mrs. Wilson Noble, Sept. 28, p. 367.  
*Eucharis* × *Stevensii*, March 23, p. 365.  
*Gooseberry*, New Spineless, July 27, p. 100.  
*Gloxinera* × *Brilliant*, February 2, p. 145.  
*Hamercallis aurantiaca major*, July 20, p. 71.  
*Mignonette Golden Gem*, February 2, p. 147.  
*Nasturtium Liliput*, December 14, p. 709.  
*Primula* "The Lady," March 16, p. 327.  
*Rheum Moorcroftianum*, June 22, p. 765.  
*Rose* "Echantress," December 7, p. 673.  
*Streptocarpus*, Laing's *Multiflora*, Aug. 21, p. 211.  
*Sweet Pea*, New Dwarf, June 29, p. 793.  
*Soncio Galpini*, March 9, p. 295.  
*Tchihatchewia isatidea*, August 10, p. 151.

## STRATHFIELDSAYE.

(Continued from p. 8.)

Crossing the tennis-green, the eye at once rests on a fine group of about twenty specimens of the *Wellingtonia* (*Sequoia gigantea*), evidently at home, and growing fast into fine trees. At a little distance is noticed another fine thriving *Wellingtonia*, planted by the Prince of Wales in 1875, a companion tree to that in the pinetum planted in the same year by the Princess of Wales. Many fine old trees—Oaks, Elms, Limes, Cedars, and such like, adorn this part of the grounds; and numerous young trees of the best ornamental varieties have been recently planted under the direction of the Duke and Duchess of Wellington, who take a personal interest in the welfare of their grand old trees, and the hosts of rare and beautiful younger subjects, that lend a charm and interest to the landscape around their ancestral home, an example that might be followed with great advantage by many others throughout the country. In passing along, admiring the rare and beautiful trees on either hand, we were astonished above all to find such a unique specimen of the Tupelo tree, *Nyssa silvatica*. This beautiful North American tree appears to have established itself better at Strathfieldsaye than in most other places in this

country. It is a fine tall tree, 72 feet in height, with long slim branches drooping gracefully to the ground. Its glossy *Gardenia*-like foliage, and graceful habit, render it at all times particularly striking, but it is in the autumn, when the tree has assumed its richest mantle of crimson foliage, that it is to be seen in its greatest beauty.

Forming a conspicuous feature in the foreground in looking out from the principal front of the mansion towards the deer park, are three noble Elms, girthing respectively, at 4 feet from the base, 16 feet 6 inches, 14 feet 8 inches, and 14 feet 6½ inches. A little farther off, and between the terraces and the river Loddon, which widens into lake-like expanses as it flows through the deer park, are two grand old Oaks, with girths of stem, at 4 feet up, of 17 feet 8 inches and 16 feet 6 inches respectively; but the top of one of them has been badly broken by the western gales which sweep across this portion of the park with great force. A pair of large Oriental Planes, with fine umbrageous heads, stand right and left of the view of a charming expanse of the Loddon from the end of the terraces, and frame it in living green.

Moving along the terrace towards the conservatory, a beautiful Cedar was noted, gracefully clothed with branches to the ground, and bearing a fine crop of cones. What may well be termed "the gem" among the beautiful trees in the grounds, is a queenly specimen of the deciduous Cypress, *Taxodium distichum*. Its tall, spreading, well-balanced head, richly clothed with small soft foliage of a delicate Pea-green, now beginning to assume the rich brown tints of autumn, was a sight to remember when first seen at a distance of about 50 paces. With a clean stem of 9 or 10 feet, it affords a grateful shade in a warm summer afternoon, which is often taken advantage of by Her Grace the Duchess of Wellington for an open-air tea. From beneath the tree a charming view is obtained over the terraces, the Loddon in the foreground, and a wide expanse of well-wooded landscape beyond. A short distance to the west of the mansion by the walk leading to the quiet pretty church, there stands another grand Cedar, measuring at the surface of the ground 25 feet 6 inches in girth; and at 4 feet up 17 feet 3 inches; but a terrible storm in 1886 sadly defaced the splendour of its head, although it is still a notable tree.

Leaving the grounds, and driving for about a mile across the picturesque and beautifully undulating park, and up the slopes of a well-wooded ridge, we arrive at the Wellington Avenue, which sweeps along near the crest of the ridge, with a slight dip to the right, till it terminates at the Wellington Monument. The monument is a tall handsome column, surmounted by a statue, erected to the memory of the great Duke, and standing on the highest point of the ridge, it overlooks a wide extent of country towards Windsor, the Surrey hills, and Aldershot, and forms a prominent object in the landscape. The avenue was planted about thirty years ago, and is formed entirely of *Wellingtonia* (*Sequoia gigantea*). Many of the trees have attained to a fine size in the time, considering the thin soil and the elevation at which they are growing. They have all the fine symmetrical habit of those already noted in the grounds, and, with a few exceptions, where they have been set in sour soil or stand much exposed to the blast, they present a fine healthy appearance, with an average height of near 40 feet, and form a particularly characteristic avenue leading up to the great Duke's monument. For most of its length the avenue is sheltered from the strong westerly gales by a high plantation; and meses are now

being taken to shelter the exposed parts, and to renovate or renew the few trees that have suffered from wet or exposure. In the ornamental plantations in the vicinity of the monument are seen many fine vigorous specimens of the newer Conifers, including some handsome trees of the Wellingtonia, all thriving admirably in the thin meorish soil and deep gravelly subsoil in which they are planted. Much skill has been displayed in laying-out the plantations, and in selecting the most favourable spots for the effective display of the choicest trees and shrubs, the latter chiefly Rhododendrons, which naturally grow and flower well in such a soil.

We return through the woods by another drive, and note many fine examples of forest and ornamental trees; the Conifers, in particular, being generally pictures of health, and much care is now being taken to prevent their less ornamental neighbours from intruding upon the space required for the full development of their natural beauty. Entering the deer-park and crossing it for some distance, we come to perhaps the most interesting historical tree in all this richly-wooded domain. On a tablet placed at the foot of the tree it is recorded that this Cedar of Lebanon was brought by the Duke of Wellington from Knight & Perry's nursery, Chelsea, in his carriage, and planted on this spot at the same time, when he came to take possession of Strathfieldsaye in 1817. In the seventy-eight years that have elapsed since it was planted, it has grown well, and developed into a sturdy and characteristic example of the Lebanon Cedar. The massive stem of about 10 feet in height, has the substantial girth of 13 feet 6 inches at 5 feet from the ground, and carries a wide-spreading head of branches to a height of about 50 feet. The tree is in vigorous health, with the branches thickly dotted with a fine crop of cones, and although it stands in a rather exposed spot, and has suffered damage to its branches by the strong gales, it bears all the appearance of lengthened vitality, and may be expected to carry down to distant generations the historical reminiscence connected with the planting of it on the spot where it is growing. It is a conspicuous object in the landscape of the park, and is well seen, across the Loddon, when looking south from the mansion. With this notable Cedar, our remarks on the trees at Strathfieldsaye may close, as by this time a most enjoyable and interesting day was well spent, and we were soon on our way to the station for London, feeling thoroughly satisfied with our visit to this fine historical domain, with its numerous objects of great interest to the lovers of rare and noteworthy trees. D.

### GARDENERS AND CROWS.

GARDENERS, no less than farmers, are wont to regard the crow [rook] as their enemy rather than as their friend, for while the farmers charge him with pulling sprouting corn, and with injuring corn "in the milk," gardeners complain that he destroys cultivated fruit; while the housewife adds her plaint to the general chorus of reproach raised against the common crow, when she avers that the bird feeds on the eggs and young of the poultry.

The United States Department of Agriculture some ten years ago decided to investigate these charges, and accordingly in 1885 a general request for stomachs was made. As a result of this investigation, there has just been published a very interesting pamphlet of some ninety pages entitled "The Common Crow of the United States." It has been written by Messrs. Walter B. Barrows and E. A. Schwarz, and it is based on the examination of the contents of nearly a thousand stomachs. The quantity

and quality of the evidence seem sufficient to justify a final conclusion respecting the economic status of the crow, and in summing up the benefits and losses to farmers and gardeners resulting from the food habits of this bird, Mr. C. Hart Merriam, the Chief of the Division of Ornithology and Mammalogy, is able to say that he regards it as clear that the good exceeds the bad, and that the crow is a friend rather than an enemy to those engaged in agricultural or horticultural pursuits.

The vegetable food of the crow amounts to about 59 per cent. of the whole food. About one-sixth of the food appears to consist of fruits, wild and cultivated, of which less than one-fourth is of any consequence to man.

Judging from the results of stomachic examinations, the cultivated fruits most often attacked are Grapes, Cherries, Strawberries, Raspberries, Blackberries, Apples, Pears, and Water Melons. Although the crow, no doubt, does destroy cultivated fruit to a certain extent, it must be remembered that as an offset to his bad habits he is to be credited with the good done in destroying noxious insects and other injurious animals. Insects form 26 per cent. of the entire food of the common crow, and the great majority of these are grasshoppers, May-beetles, catworms, and other injurious kinds. To the same side of the scale must be added the destruction of mice, rabbits, and other injurious rodents by the crow. This report on the food of the crow is an excellent example of the admirable and thorough method adopted by the United States Department of Agriculture, which has proved itself of very great service to the American agricultural and horticultural interests. Many of the notes and stomachs that have formed the basis of this report were collected by voluntary assistants in various parts of the country.

Our County Councils should pay more attention to the subject of agricultural zoology, and let us hope that the day will not be far distant when we shall be able to look with pride on our Board of Agriculture, and shall be able to affirm that it is second to none in the world. H. C. F.

### THE ALTAI FLORA OF WESTERN SIBERIA.

THE high ranges of the Altai, known by the native name of "belki," which exactly corresponds to the term "Alps," rise far above the snow-line, and extend for a great distance almost parallel, separated from each other by the deep ravines of the mountain streams. Over the whole of this vast mountainous area, situated between the limitless and relatively moist plain of Western Siberia, sloping to the Arctic Ocean, and the almost equally unlimited and parched steppes of Central Asia, a struggle is constantly going on between the north and north-west damp aerial currents and the southern and perfectly dry winds in the lower layers of the atmosphere. Consequently, polar forms, or an isolated and high alpine vegetation prevail on the northern slopes of the Altai; whilst its southern slopes are climbed by the flora of the Central Asiatic steppes, differentiated into a whole series of original high steppes varieties. To such forms belong, for example, the peculiar species of Astragalus and Oxytropis of the Altai meadows of the alpine zone.

The flora of the polar tundra zone presents very little difference from that of the European tundras of Russia, Lapland, and Samoyed. In European Russia, scarcely any of the low-growing stunted shrubs characteristic of this zone are met with, as, for example, one species of Arbutus (Arctostaphylos alpina, Ad.), the Heathers, or Andromedas (Cassiope tetraneura, Don, and C. hypnoides, Don.), Pajllodoce taxifolia, Salix, Loiseleuria procumbens, Don, a species of Ledum latifolium, Ait., also belonging to the European flora, and only one species of the polar Azulea (Osmothamnus fragrans, D.C.), and one polar Willow (Salix arctica, L.).

The mountain flora of the Altai uplands, on the other hand, is of quite a different nature. Here, beginning already at a height of 8000 feet, the vege-

tation is extremely peculiar, and gradually passes into the alpine flora proper to that of the Asiatic Alps. Of course, this flora includes not a few plants pertaining to the arctic zone of the Old World which also climb the European Alps, but an enormous proportion of the plants are the typical and peculiar property of the alpine and sub-alpine zones of the Altai Sian mountainous region. Among the shrubs characteristic of the latter zone may be noticed a few species of Caragana, C. microphylla, Lam., C. Bungei, Led., C. pygmaea, D.C., C. spinosa, D.C., and C. tragacanthoides, Poir.; two Dog Roses (Rosa platyacantha, Schr., and R. Gableriana, Schr.); the Galten tree (Cotoneaster aniflora, Bge.); some species of Carant (Ribes aciculare, Sm., R. saxatile, Pall., R. caneatam, Kar.; R. heterotrichum, Moq.; and R. procumbens, Pall.); two species of Tamarisk, Myricaria alopecuroides, Sch., and M. dahurica, Ehr.; three Honeysuckles (Lonicera humilis, Kar.; hispidula, L.; and Bungeana, Led.); one species of Azulea (Osmothamnus pallidus, D.C.), and two Rhododendra (Rhododendron chrysanthum, Pall., and R. davaricum, L.). Among acicular-leaved shrubs are the Ephedra stenoperma, Schr., and E. intermedia, Schr.; Juniperus pseudo-sabina, Fisch., and J. davarica, Pall.; and two kinds of Birch (Betula microphylla, Bge., and B. tortuosa, Led.).

Much more characteristic is the herbaceous vegetation of the alpine and subalpine meadows and slopes which enchant the eye with the richness and brilliancy of their flowers. The following may be indicated as among the species most characteristic of the Altai Sian mountainous system; a few beautiful Anemones (Anemone umbrosa, Mey., A. Fischeriana, D.C., and Palastilla Bungeana, Mey.); peculiar kinds of Crow's-foot (Ranunculus altaicus, Laxm., R. longicaulis, R. pulchellus, R. natans, R. lasiocarpus, R. propinquus, R. grandifolius, Mey., and exceptionally interesting Oxygraphis glacialis, Bge., and Callianthemum rutae-folium, Mey.); a Ranunculus with pale lilac flowers (Hegemone [Frolline] lilacina, Bge.); the Larkspur, Delphinium laxiflorum and dictyocarpum, D.C.; three Fimitories (Corydalis nobilis, Pers., stricta, Pers., and inconspicua, Bge.). As many as thirty Altaic species of C. cuciferae belonging to the high alpine zone (of the genera Mathiola, Arabis, Parrya, Macropodium, Pailotrichum, Draba, Ho-largidium [Draba], Chorisporum, Oionotetium, Braya, Eatrema, and Ha'chinsia); charming species of Violets (Viola altaica, Pall., V. macrocarpa, Bge., V. imbricata, Led., and V. acuminata, Led.); about fifteen peculiar species of Caryophyllaceae and Stel-laria; Altaic varieties of flax (Linum violaceum, Bge.); St. John's Wort (Hypericum G. bleri, Bge.); some forty beautiful and variegated sorts of Legu-minosae, among which are especially prominent the numerous species of Astragalus and Oxytropis, which extensive genera climb from the Central Asiatic steppes to the eternal snows of the Asiatic mountain ranges. Next follow the quaint high alpine forms of Rosaceae (Sibbaldia adpressa, Bge., Dryadantha Bungeana, Led., [Potentilla], Potentilla altaica, Bge., and Comarum Salesnowi, Bge.). There are also a few characteristic Saxifragae, among which, in particular, is the so-called Chagyr tea (Saxifraga crassifolia, L.), the large leaves of which serve the natives as a substitute for tea. There are some twenty species of Altaic Composites among them several species of Saussurea, S. pygmaea, Spr.; pycnocephala, Led.; latifolia, Led.; acuminata, and foliosa, Led.). Finally, the Primulaceae largely contribute to the adornment of the alpine meadows of the Altai (Primula longicaapa, Led.). There are charming blue and yellow Gentians (Gentiana atrata, Bge.; G. azurea, Bge.; G. tenuis, Bge.; G. altaica, Pall.; G. Karelini, Fries.; G. frigida, Haenk.; and G. macrophylla, Pall.) Irises (Iris glaucescens, Bge.; I. Blondowi, Led.; and I. tigris, Bge.). Among the bulbous plants are Tulipa altaica, Lillium tenuifolium, Fisch., and L. spectabile, Link.; Eritrillaria verticillata, W., and many other charming varieties. J. St. Vincent Corporan Ojessa, South Russia.

## CULTURAL MEMORANDA.

## ON PRUNING GOOSEBERRY BUSHES.

No greater error prevails in the culture of this fruit than the practice of cutting back individual shoots to within a bud or two of their base, with the result that a thicket of shoots and small fruits are produced. To obtain fine large berries as well as handsome bushes heavily laden with large fruits, thin out the shoots freely just before growth commences in spring, and any which are very long and weak shorten back a little, so as to promote a balance of growth in the bush, and prevent the fruit-laden shoots from dragging the ground. Thus treated, the bushes, in consequence of the weight of the crop, will assume a pendulous habit, and the centre of each being partly open, the crop can be gathered conveniently. If the pruning operation be deferred until growth is imminent, the cultivator may retain shoots which have not been "disbudded" by the birds, and cut out any which are denuded of buds. When the prunings have been removed, draw with a rake 1 inch thick of the surface-soil back about 3 feet from the stem of each bush; and when the branches are damp, dust them well with a mixture of fresh lime and soot; this will kill the moss, as well as destroy the larvæ of the Gooseberry caterpillar; then apply a good surface-dressing of short manure, and point it into the ground with a five-tined fork. *H. W. Ward.*

## THE WEEK'S WORK.

## THE HARDY FRUIT GARDEN.

By G. WOODGATE, Gardener, Rolleston Hall, Burton-on-Trent.

**BLACKBERRIES** are not grown nearly so much as they deserve to be; yet the fruit makes a first-class preserve, and is very good in tarts when mixed with Apples. It is available, too, when most other bush fruits are past. The two chief varieties grown here are *Rubus laciniatus*, and the American variety, *Wilson Junior*. Both of them have a robust constitution, and bear excellent crops of fine large fruit. The first-named makes yearly growths of from 8 to 10 feet in length, and requires the support of a trellis. A light and useful one may be made with iron standards 1 inch in thickness and 7 feet long, and which would, after being driven into the ground, be from 4 to 5 feet high. Those for the ends should be a little stouter, and have a stay fixed to them. A small hole through the standards is required about an inch from the top, and sufficiently large to take a wire about one-eighth of an inch thick. The holes in the end posts should be large enough to take an ordinary straining eye with a nut attached, for the purpose of tightening the wire. The standards should be about 8 feet apart, and a Blackberry root planted against each, so that the growths may be trained up the standards, and then along the wire. *Wilson Junior* has a more stocky habit, growing from 5 to 6 feet high, and requires no support. A warm sloping border suits this variety exactly. The culture of the Blackberry is much the same as that of the Raspberry, and all that should be necessary to be done at this season is to cut away all the old fruiting-canoe, and tie up the young growths loosely to the supports. Four strong canes to each stool are sufficient to leave of *R. laciniatus*, but six or eight may be left to each root of *Wilson Junior*, cutting out the remaining ones. Afterwards give a good dressing of rich farmyard manure, which may be dug in lightly with a fork if desired, but the work must be done carefully, as the roots ramble near the surface.

**STRAWBERRY BEDS**, which may not yet have had their annual trimming and top-dressing, should be attended to at once. Take up all runners that have established themselves between the rows, remove all dead leaves from the old plants, and then afford a good dressing of fresh lime, or lime and soot mixed, dusting it well in around the crowns, where it will reach any slugs that may be there. If the soil is heavy, the space between the rows may be broken up a few inches deep with a fork, but if not, the surface need not be loosened at all before giving it a good mulch of half-decayed farmyard manure, which, if put on now, will be washed clean by rain before fruit ripening commences.

**RASPBERRIES**.—All the old fruiting canes and weakly growths should be cut away, leaving from six to eight of the strongest canes to each stool for next season's fruiting. Tie the remaining ones neatly to their supports, and give the whole of the space between the rows a good dressing of manure.

**BUSH-FRUIT**, such as Currants and Gooseberries, should be pruned as soon as convenient. Gooseberries require the side growths spurred back to within an inch of the main branches, and the young wood should be shortened to about 4 or 6 inches; some varieties have a pendent habit of growth, but all shoots that are in contact with, or likely to produce shoots that will touch the ground, should be cut clean away. Red and White Currants require much the same pruning as the Gooseberry. Keep the side growths spurred in, and the main branches sufficiently few to admit plenty of light and air when the trees are in full foliage. The black varieties only require to have the dead wood taken out, and all superfluous growths removed to prevent crowding. If any of the trees are infested with moss or lichen, a dusting of fresh lime, when the trees are damp, will soon clear them.

## THE ORCHID HOUSES.

By W. H. WHITE, *Burford, Dorking.*

**SCHOMBURGKIAS**.—The species *Schomburgkia undulata*, *S. Lyonsii*, and *S. thibetica*, although not generally held in much favour, are interesting plants, whose flowers are produced upon scapes nearly 1 yard in length. The flowers, when fully expanded, form striking objects in the houses, lasting several weeks. The flower-spikes of these species are at the present time pushing up, and the plants require careful watering to preserve the new pseudo-bulbs and the inflorescence from decay. At this particular season only a moderate amount of water should be afforded, the plants being allowed to become thoroughly dry at the root before applying it. It should be remembered that it is not good practice to afford water as soon as the surface of the compost merely appears to be dry, but sufficient time should be given for the moisture that gathers about the confined roots to evaporate. A closely-allied species to *Schomburgkia* is *Lælia superbiens*, our plants of which are showing for bloom. The scandent habit of its flower-spikes, which often grow to 4 feet in length, renders some amount of training necessary, and in doing this, the point of the spike should be kept well up towards the roof-glass. Either of the above-mentioned species succeeds in pots in the Cattleya or Mexican-house.

**PLATYCLINIS GLUMACEA**.—Plants of the graceful *Platyclinis glumacea* show their rosy-coloured growths at this season, and when this is remarked, they should be removed from their resting quarters in the intermediate-house to the cooler part of the East-Indian house, and brought up as closely as possible to the roof, which will have the effect of causing the breaks to start freely away. When these young growths begin to push upwards, and the new roots that quickly follow enter the soil, the quantity of water afforded should be gradually increased, and on sunny days the under-side of the leaves syringed in order to check the increase of red-spider. The plants may be repotted immediately growth has begun, or within a short space of time after flowering. *Platyclinis* root and grow freely in a compost consisting of good fibrous peat and sphagnum-moss, intermixed with a moderate quantity of clean crocks. Another species well worthy of a place in collections is the pretty *P. uncala*, with graceful threadlike racemes which are almost similar to the well-known *P. filiformis*, but the flowers are of a greener shade, and individually smaller. After the flowers have faded, the plant may be repotted if this be necessary, and kept fairly moist at the root till growth is complete. The best place for this species the whole year is the intermediate-house. At the present season *P. filiformis* is at rest, but it should not be allowed to become too dry, as then the leaves are apt to become yellow and fall off, a state of things that may be averted by an occasional syringing overhead. The Cattleya or intermediate-house is the best place for it till growth begins.

**CYPRIPIDIUMS**.—Plants of *Cypripedium Spicerianum* and *C. Charlesworthii*, which have recently ceased flowering, may be repotted. Neither species require much root space, and they should be slightly raised above the rim of the pot, the pots being three-fourths filled with crocks, &c. The compost should consist of equal parts of lumpy peat and chopped sphagnum-moss, crocks or broken limestone about

1 inch square mixed with it. *Cypripedium insigne* is a general favourite amongst gardeners, because of its easy culture, the handsome flowers remaining fresh for some weeks, and their value for cutting and for other decorative purposes. Plants of the type and its varieties may be re-potted as fast as they pass out of flower. Fortunately, *C. insigne* requires no special kind of compost, and the ordinary Orchid potting-mixture suits it. Other varieties of *Cypripedium*, as *C. Leeanum* ×, *C. Arthurianum* ×, *C. purpuratum*, *C. venustum*, *C. Crossianum*, *C. Williamsii* ×, *C. Amesianum* ×, &c., if they have become pot-bound, should be re-potted into larger pots, healthy plants being shifted into pots two sizes larger. Water must be freely afforded at all times. Any of the above-named *Cypripediums* thrive in a shady part of the intermediate-house. When grown in a very light position, they frequently lose more leaves than is desirable, and are more subject to be infested by insects.

## THE KITCHEN GARDEN.

By C. HERRIN, Gardener, *Droghmore, Maidenhead.*

**MUSHROOM-HOUSE**.—If the earliest bed is showing signs of exhaustion, manure for a new one should be obtained, and when a good heap of it is collected, it must be turned over and well mixed together at least every other day until a sufficient quantity has been prepared. An open shed, from which the rain only is excluded, is the very best place for the preparation of Mushroom-bed materials. It is advisable to keep it in the shed until it is in a proper state to wheel into the Mushroom-house, spawning it at once. By thus carrying out the preparation, the formation of rank steam in the latter is avoided. Our Mushroom-beds are doing remarkably well this year; the earliest-spawned bed, from which Mushrooms were gathered the first week in October, is still producing excellent Mushrooms. Much of the success achieved is due to the thorough preparation of the manure before spawning the bed, and the good quality of the spawn.

**SEAKALE, CHICORY, AND RHUBARB** are usually forced with the least amount of trouble at the warmest end of the Mushroom-house, and in the case of our house part of one end is enclosed, so as to keep it closer and warmer than the other part. The roots of Seakale should be brought in at intervals of four or five days in batches according to requirement, it being advisable to force it in small quantities and often, the heads of Seakale not improving by being kept, becoming spidery, and less tender when cooked. Chicory forms a very useful adjunct to winter salads, and is easily produced without much trouble in the same manner as Seakale. Rhubarb forces easily after this date, and a few roots should be introduced to the Mushroom-house as often as may be required to ensure a constant supply.

**HOT-BEDS**.—Presuming that preparations have been in progress for some weeks past by collecting and frequently turning fresh tree leaves and stable-manure, the former in double or treble the proportion to that of the latter, hot-beds may now be made up. These will be required to heat frames in which to grow early Carrots, Potatoes and Radishes. If stable-manure is scarce, the beds intended for Carrots may be made almost entirely of good Oak or Beech leaves, taking care to well tread them in small quantities as they are put on. It will be necessary to work-in some long litter—or bracker, which will answer the same purpose—all round the sides of the bed to prevent the leaves falling out, and keep the sides secure when the frame is placed on it. The bed should be made large enough to allow at least 1 foot of space all round outside the frame intended to be used, and after making to the height of not less than 4 feet, the sides should be trimmed with a sharp hook or shears, which will leave a workman-like finished appearance. When the surface has been levelled, and the frame placed on it, a thin layer of leaf-soil should be added, and then the soil may be put in. The latter should be a sandy loam, and be 5 inches in depth after having been lightly trodden to make sufficiently firm, and left a few days before sowing to become warm. A small quantity of wood-ashes and soot may be added with advantage.

**CARROTS**.—I find a three-light frame will supply sufficient early Carrots for a moderate establishment, until those sown out-of-doors are ready, the kinds grown being Parisian Forcing, Early Nantes, and Sutton's Early Gem. We have one light of each, and sow broadcast, covering slightly with finely-sifted soil. I usually sprinkle a few seeds of Early Paris Market

**THE FLOWER GARDEN.**

By HEDLEY WARREN, *Gardener, Aston Clinton, Tring.*

**BEDDING PLANTS.**—All of these should be frequently looked over, removing all dead or decaying leaves or stems, and on the first appearance of green-fly, thrips, or other insects, the plants should be fumigated, Pelargoniums and Verbenas especially demanding attention in this particular. *Lobelia fulgens*, *Lyalmachias*, *Pentstemons*, *Violas* and similar plants that are being wintered in frames will need very careful watering; in fact, very little water is required at this time of year, the plants being almost dormant, but they need free ventilation on all favourable occasions, so as to disperse superfluous moisture that may be present. Layers of border Carnations which were potted and placed in frames will also require similar treatment until there are signs of active growth. Where it is intended to use for bedding purposes during the coming season such kinds of plants as Golden Privet, variegated and green Veronicas, it would be well to buy in the number required without delay, which, if potted up and placed in cold frames, will be in good condition for planting out in May or June. These plants, if used with crimson-coloured Pelargoniums, *Iresines*, or *Begonias*, make a very pretty and showy display. The stock plants of *Fuchsias* may now be pruned slightly and placed in gentle heat, so as to produce shoots fit for making cuttings, which, if gently grown-on after being struck, make excellent plants for summer bedding. The spring propagation of bedding plants will shortly commence in earnest, so that the preparations should be made for having everything in readiness. The propagating pit or frames should be put into good order, and pots, boxes, pans, labels, stakes, soils, and sand in sufficient quantities, be got in readiness—in fact, every preparation made so as to avoid delay when the time comes.

**TUBERS, ETC.**—Examine *Dahlia* roots, *Gladiolus* corms, tuberone-rooted *Begonias*, and others that are in store, and see to the labelling, labels being very apt to get displaced owing to the shrivelling of the stems to which they were attached. Guard against rooks, rats, mice, or other vermin which often destroy the Dutch and other bulbs planted out in the flower-beds, rooks especially doing much harm in some gardens at this time of the year. The birds are readily scared by the gun, and if it be used once or twice they will generally do but little further damage. Against mice, &c., use baits of phosphorus or other paste. Bulbs that are showing through the soil should be mulched with cocoa-nut fibre refuse, putting on additional fibre should severe weather set in.

**ROSES.**—The bushes still retain in many places a quantity of foliage, and in some instances the shoots appear to be unripe. Long straggling shoots may be shortened so as to give a tidier appearance to the plants, but no regular pruning should be done at the present time.

**SHRUBBERIES.**—All beds and borders should be made clean and tidy by removing all superfluous decaying matter, and if necessary the surface of the ground lightly pricked over with a digging-fork. Where an undergrowth is desired, plant *Mahonia aquifolia*, *Cotoneaster microphylla*, *Aucubas*, *Ivies*, *Periwinkle*, and *St. John's Wort* in variety, either of the three latter making also very pretty edgings to walks through shrubberies where grass will not thrive, and their use dispenses with the too often used but most inappropriate tile-edging. In selecting plants for the above purpose, see that they are strong and well-rooted. If procurable on the estate, gravel may be dug and sifted in readiness for repairing walks and drives, which may now be attended to, when other outdoor work may be at a standstill.

**FRUITS UNDER GLASS.**

By W. POPE, *Gardener, Highclere Castle, Newbury.*

**EARLY PEACHES.**—Peach-trees started at this time will need careful attention, observing that the borders have been well supplied with water, dryness at the roots being a frequent cause of failure in Peach-culture. Close the house with a temperature of 45° at night, and 50° in the day-time with fire-heat. Syringe the trees twice a day, and when the buds begin to push a little, air may be given daily in favourable weather. Shut up early with sun-heat, so as to see as little fire as possible at this stage.

**STRAWBERRIES IN POTS.**—Put a number of plants into heat about once every fortnight, according to the space at command, and the probable demand for fruit. Keep them near the glass, and give them a

Cabbage Lettuce with the Carrots; these are up, drawn out, and transplanted to other frames or boxes before the Carrots attain any great size. Radishes may be grown in a similar manner.

**EARLY POTATOS.**—Where available, good brick pits are preferable for Potatos. They should now be filled 4 feet in depth with hot stable manure, well trodden. On this place 9 inches of moderately light soil, but allow at least 1 foot of space between the surface of the soil and the glass. Defer planting for a week until the heat has risen, and the soil is slightly warmed. The sets for this early planting should be but slightly sprouted. Any dwarf-growing Ashleaf variety may be used for planting; Sharpe's Victor, Ringleader, and Veitch's Ashleaf are three good ones. All pits and lights should be thoroughly cleaned before using; the glass especially must be quite clean. If a few dishes of very early Potatos are required, prepare a few 8 and 10-inch pots, and fill them two-thirds full of nicely-prepared soil, a few partially decayed leaves being placed in the bottom for drainage. Plant one good tuber in each pot, and keep them at present in a Peach-bone recently started.

**PLANTS UNDER GLASS.**

By JNO. MCINTYRE, *Gardener, Woodside, Darlington.*

**TEMPERATURES.**—The winter, so far, has been open, and temperatures have been maintained without firing. During the winter months, in plant structures, it is much better, during severe weather, to allow temperatures to fall a little below usual heat than to make the pipes severely hot. High temperatures obtained by such means, when moisture cannot be given in quantity without injury, induces red-spider, thrips, and other insects in abundance, especially on stove plants. Make preparations for the approaching growing season by thoroughly cleansing the houses. Take down the creepers from the roof and well wash all wood and ironwork with soft-soap and water. If the work be thoroughly done now, before the plants commence to grow, it will save much labour when pressure of work is great in all departments. Carefully examine all plants, and clean them from pests. Though it is tedious to sponge specimen plants by hand, where it can be done it is the most effective method of cleansing, and should be adopted. Those which are not too large, but can be easily handled, may be dipped in one or other of the various insecticides, it being a much quicker way of cleansing plants. Hand sponging of all plants gives a clean healthy appearance that no other method of cleansing does.

**GLOXINIAS.**—Very good results may be obtained by raising *Gloxinias* from seed; indeed, if seeds are obtained from the best source, they are quite equal, so far as usefulness is concerned, to named varieties. Sow seeds now to produce flowering plants about June or July. Sow them in thoroughly clean and well-drained pans, and use a rich light, compost that contains one-third of silver-sand. Lightly cover the seeds with sand, and place a sheet of glass over the pan until they have germinated. If any watering be done, be careful not to disturb the seed in any way.

**CROTONS.**—Any scarce varieties it is desired to increase should now be propagated. Take cuttings and insert them singly in 2½-inch pots in equal parts silver-sand and sifted loam. Such early propagation is only advisable in the case of novelties.

**LILIUM LANCIFOLIUM** will require looking to now if the plants have not already been attended to. The plants should either be given a good top-dressing or repotted, as the case may require. In potting *Lilium* it is proper to keep them well down in the pots, leaving at least 2 inch space above the soil for a top-dressing when they have thrown out roots from the base of the stems. Soils for *Lilies* should be rich and of a lasting nature. Use two parts rich fibrous loam, one part peat not too finely broken, one part good river-sand, and one part charcoal or wood-ashes. When potted, plunge them in coal ashes or other light material until they commence to grow. For decorative work *Lilies* are indispensable, and no amount of trouble should be spared to grow them well.

**FORCING-HOUSE.**—Pot up a few hundred imported crowns of *Lily of the Valley* into cocoa-nut fibre refuse, which have been well exposed to the weather for the last two months. The Mushroom-house will suit them well if it be dark, and there is a temperature of 60° to 65°. Remove to the light a week or so previous to the blooms expanding. Introduce a batch of *Lilium longiflorum Harrisii* for furnishing the earliest blooms.

temperature of 45° to 50°. Previously-started plants should have the temperature raised to 55° at night when they come into flower, with a corresponding increase in the day-time. Ventilation must be given whenever possible, taking care to avoid currents of cold frosty air blowing on the plants.

**CUCUMBERS.**—Where these plants have been fruiting through the winter, and they are showing signs of exhaustion, afford the beds a top-dressing of fresh loamy soil, of not too heavy a texture three parts decayed manure and leaf-mould one part, with a sprinkling of Thomson's Vine Manure. When the warmth inside falls below 65° or 70°, coverings should be employed wherever practicable, and these may consist of canvas, *Frigi Domo*, or mats, placed over the glass, to keep in the heat, which is better practice than to drive the fires hard. The day temperature may reach 75°, when air may be given, a little being given every day when there is no frost. Shut up the house, &c., early with sun-heat, and sprinkle the bed with warm water once or twice daily. Avoid, however, making much vapour by sprinkling the hot pipes. Allow the plants to carry only a moderate crop of Cucumbers at any one time, and remove all the male blossom, whose preservation only tends to produce weakness. If Cucumbers are required in the spring, seed may be sown forthwith, putting two or three seeds each into 48-sized flower-pots, clean, and half-filled with light loamy soil; press down the soil before sowing, and cover lightly without pressing. Place a bit of glass over each seed-pot, and plunge in a bottom-heat of 85°. When the plants come up, keep them near the glass, and earth-up with a little previously-warmed soil when the plants top the sides of the pots. For the earliest sowing, none is better than a good strain of Rollison's Telegraph.

**MELONS.**—Melon seeds may be sown at this date, to furnish plants for an early crop at the end of April or beginning of May. The seeds should be sown singly in small 60s, and plunged in a bottom-heat of 85° to 90°, with an air temperature of 70° to 75°. This is best afforded by the fermenting hot-bed. As soon as the Melon plants appear, keep them near the glass, to prevent etiolation, putting a stick and tie to each plant when 6 inches high. If the ordinary hot-bed is to be used for growing and fruiting plants as well, fresh materials, as Oak and Beech-leaves, and stable-dung, mostly the straw, should now be thrown together into a heap, to sweeten and get rid of the rank heat engendered by fermentation at first; turning and mixing all thoroughly once or twice before making them up into a hot-bed. Make the bed 1 foot broader and longer than the frame that will cover it, beating or treading it regularly and firmly as it is built up. Four feet at the back and a little less at the front will be a suitable height. The heat should be maintained by linings of fresh manure, partially or wholly renewed when their warmth has declined. Straw-covered hurdles, or bracken confined by hurdles, will do much to keep the linings warm. See that no rank steam gets into the frame, either from the bed itself, or by the slight opening it is prudent to leave at the back of all freshly-made hot-beds. The steam is easily drawn into the frame at this point if the mats reach beyond the frame.

**WYCOMBE ABBEY.**—It is stated, says the *Builder*, that Lord CARRINGTON, who recently purchased Gwydyr Castle,\* has decided to sell his seat in Buckinghamshire, Wycombe Abbey, with its timbered park of about 300 acres, or the sporting estate, extending over 3000 acres. Wycombe Abbey represents the manor-house of Loakea, which had been demised to the Templars by ROBERT DE VIFONT. The manor-house was rebuilt in the reign of James I., and greatly improved by HENRY (PETTY), Lord SHELburne, who in 1700 had acquired the property. The house underwent further changes, and indeed was practically rebuilt of local stone, for the first Lord CARRINGTON by, it would seem, JAMES WYATT. The Abbey is included in a list of works attributed to JAMES WYATT in the *Dictionary of Architecture*. The *Beauties of England and Wales* (1801) describes the house as about to be repaired and enlarged by WYATT, and to be cased with a hard sandstone found in the neighbourhood. This stone, it adds, is dispersed over the ground in single masses, similar to the grey wethers on Marlborough Downs, but have never before been applied to the purpose of building. The cascade was made by J. LANE, who made also the cascade at Bowdoin.

\* Gwydyr had belonged to the Baroness Willoughby de Eresby, whose sister married the second Lord Carrington.

## EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

## APPOINTMENTS FOR THE ENSUING WEEK.

## MEETINGS.

SATURDAY,	JAN. 11—	Royal Botanic Society.
TUESDAY,	JAN. 14—	(Royal Horticultural Society's Committee, at the Drill Hall, James Street, Westminster.
THURSDAY,	JAN. 16—	Linnean Society.

## SHOW.

SUNDAY, JAN. 12—Russels Orchidéenne.

## SALES.

MONDAY,	JAN. 13—	Fruit Trees, Greenhouse Plants, Begonias, &c., at Protheroe & Morris' Rooms.
WEDNESDAY,	JAN. 15—	Japanese Lilies, Tuberoses, Hardy Bulbs, &c., at Protheroe & Morris' Rooms.
THURSDAY,	JAN. 16—	Ferns, Begonias, Clematis, Hardy Bulbs and Plants, at Protheroe & Morris' Rooms.
FRIDAY,	JAN. 17—	Hardy Perennials, Pæonies, Dahlias, &c., at Protheroe & Morris' Rooms; Orchids at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—36.7°.

It is desirable to call the attention of vendors, and of purchasers too, to the extremely poisonous character of many of the substances used as weed-killers, insecticides, or for purposes of spraying. When locked up in a safe place, apart from all substances likely to be used as food for man and beast, where mischievous or ignorant people are not likely to get at them, when duly labelled POISON, and cautiously used by intelligent and responsible practitioners, no harm but much good may arise. The consequences of a mistake or an oversight are, however, so extremely serious, that we cannot but urge the utmost caution in their use; and we are not disposed, as some of our correspondents are, to decry the action of the Pharmaceutical Society in undertaking the responsible duty of prosecuting persons who infringe the law by selling these substances when not expressly authorised so to do. It appears not to be generally known by seedsmen and nurserymen that they incur great risks in dealing with these substances. According to the Pharmacy Act of 1868, no person, not being a duly registered pharmaceutical chemist, or a chemist and druggist within the meaning of the Act, can legally sell certain poisonous substances, or those which contain poisonous substances.

The object of this enactment is obvious enough—and every sane man will say it is reasonable. The operation of the law is another matter. Certain of our correspondents complain bitterly against the action of the Pharmaceutical Society. They urge that a poison is no less poisonous if sold by a druggist, and no more poisonous if retailed by a seedsman, which is indeed true. It must be remembered, however, that the pharmaceutical chemist has passed through a course of education to fit him for his duties, and has passed various examinations. He is therefore presumed to

have a fuller and more intimate knowledge of poisonous substances than a grocer or a seedsman, who has given no such public pledges that he is a responsible person, and one competent to handle and dispense such dangerous ingredients. Others of our correspondents declaim against the Society as the possessor of a monopoly, and of being influenced by avaricious motives in securing for their members these exclusive privileges. Aspersions of this character are not only in bad taste, they are untrue. The Society would, we expect, gladly be relieved of what must be a very unprofitable and an extremely disagreeable duty. On the other hand, the general public would have ample right to complain if the Society did not execute the commission entrusted to it by the State. So far from being too active in the matter, we are inclined to think, it is not active enough. Of course, we are speaking of the law as it stands. That law may be capable of amendment. A seedsman's assistant is just as competent to hand over to a customer a tin of weed-killer as is his brother at the chemist's shop. Nevertheless, for the public safety, he ought, in our opinion, to exercise his calling under the same sort of restriction as the druggist does. We do not say that the druggist should necessarily have a monopoly, but we do say that he whosells such substances should be subjected to similar restrictions as the druggist is. At present, in practice, the druggist is more hampered than the seedsman, for the druggist must keep a register detailing the amount sold, the name of the person to whom given, and other particulars. The grocer, oilman, or seedsman, so far as we know, takes no such precautions. As matters now stand, a child may purchase a packet of vermin-killer or fly-paper from an oilman enough to poison half a parish. In a case alluded to by one of our correspondents, the Society seems to have made the mistake of instituting a prosecution against a seedsman's assistant, who is admitted to have sold a bottle, duly labelled poison, and with the following inscription:—"It is a poisonous compound; keep it out of the reach of dogs; cork the bottle, and lock it up when not in use." So far the assistant was not to blame, and the prosecution should have been directed, if at all, to the employers, who failed to comply with, or who infringed the law. Those interested in the subject will find a full report in the *Pharmaceutical Journal* for December 21 last. We think the conclusion of the matter is, that no one, druggist or otherwise, should be allowed to deal in these dangerous substances without in some way giving a voucher to the public that he is a responsible and a competent person.

Surely the facts of the case demand not lessened but increased restriction. The restriction, however, should operate fairly and equitably to all classes of vendors.

Fruit Culture by Farmers.

ONE is always harking back to this topic, and no wonder, when the enormous amount of foreign importations is remarked; but the only persons who seem to comprehend the situation and take advantage of the law of tenancy as it is, are the men who grow for market, and who, going into the business as a means of living, have of necessity to make their ventures remunerative if they can. The first thing these wide-awake men do is to select land quite suitable for fruit culture, and then make their investment safe from possible disturbance by a long lease. And this is the gist of the matter. Let the farmer, if he can, counsel his landlord to give him a lease of sufficient length to enable him to reap the profits of his investment of capital, be it in fruit-trees,

nut-bushes, small fruits, or what not that takes some few years to grow before full returns can be looked for, and then, if his capital and his credit be not entirely exhausted, he will, or his sons will, provided they have the requisite knowledge of the business, be able to grow good crops of fruit. The farmers' sons inspire us with much hope; some of them, we believe, are attending the various lectures inaugurated by the County Councils, and some are receiving the much-needed special instruction in the art of fruit-growing in the various horticultural schools established under the same auspices. From these young men, when not wholly given up to hunting, coursing, shooting, and billiards, we may obtain a percentage who will lift the old farm wain out of the rut. To learn to plant a fruit-tree properly, to prepare the site of the future orchard, be it of Cherries, Apples, Plums, or Pears, and to select the best varieties; to prune or superintend the pruning operations of others, and apply preventive dressings to the trees, and top-dressings when needed to the land, does not involve so severe a course of study as to prevent a young man of average ability from becoming a competent practitioner in a few years.

There was, in the beginning of the present century, and at an earlier period, a system of leases, now generally extinct, when farmers and other cultivators, feeling sure of remaining on the land for lengthened periods, planted orchards of Apples and Pears. The remains of these orchards exist at the present day, often serving to point a moral, but their present state is simply the result of age, and the substitution of very short leases and yearly tenancies for the more favourable conditions of hiring land in bygone times. These orchards being old, naturally present the appearances of age, and have reached that stage when grubbing up would be the best policy; but being under grass, they are useful to the tenant in many ways. The few fruits obtained, indifferent it may be in regard to quality, are useful in the farm kitchen, and the farmer will not, as a yearly tenant, plant new trees. Who can blame him?

The yeoman farming his own land, and the big landowner, were seldom in times gone by famed for fruit culture, except perhaps in the older-making counties; and some of the latter, we are willing to believe, are now making efforts—tentatively, as is proper—to meet the growing demand for fresh fruit, exciting hopes that we may yet see this demand well met in a few years, with the certain result that the foreign producer will not find it to his advantage to send so much of his fruit to this country as he does at the present time. The day of high prices, as a rule, is passed, although first-class fruit, packed in boxes or barrels (instead of the fruit-spoiling willow-baskets and hampers), and sent into the market in its proper season, will always fetch remunerative prices.

We think that nothing one sees in the southern and western counties is so eloquent of the need of change in farming tenancy as the numerous worn-out orchards.

SIR JULIAN GOLDSMID.

THE news of the death of this gentleman will be received with deep regret by the gardening community. In spite of his multifarious labours as a politician, the claims of charity, independently of creed or race, were by him considered paramount. This judicious magnificence was as prominent a feature of his character as were his culture and practical sagacity. SIR JULIAN took high honours at the University of London, practised for a short time at the Bar, and then devoted himself to political affairs, managing to

secure the respect and confidence of all parties. When, in 1887, the Gardeners' Orphan Fund was established in connection with HER MAJESTY'S Jubilee, Sir JULIAN GOLDSMID, in spite of his many engagements, became the first President of the Institution, and those who were associated in starting this beneficent Society will remember with gratitude the valuable aid which his great experience enabled him to give, and the warm support he always extended to the young Association. On many occasions he

- B.—The best Hardy Plant not previously shown at any of the Society's Meetings (Narcissus excluded)—Open.
- C.—The best Stove or Greenhouse Plant (Orchids excluded), not previously shown at any of the Society's Meetings—Amateurs.
- D.—The best Stove or Greenhouse Plant (Orchids excluded), not previously shown at any of the Society's Meetings—Open.
- E.—The best Orchid not previously shown at any of the Society's Meetings—Amateurs.
- F.—The best Orchid, not previously shown at any of the Society's Meetings—Open.

II. PLANTS OF HOME PRODUCTION.

- G.—The best Hardy Plant (raised and shown by an Amateur).

The above Prizes may be competed for at any meeting of the Society in 1896 except at the Temple and Crystal Palace Shows.

The Judging will be by points, which will be duly kept and recorded, and the winner will be announced at the end of the Season.

The Council reserve the right to withhold all or any of the Prizes if none of the exhibits are considered worthy of marked honour.

As many details as possible should be given about the exhibits, as fullness and exactitude of information may decide the Prize in case of equality of points.

All entries for the above Special Prizes must be made before 11 A.M. on the morning of the Show on a Special Form, which may be obtained of the Clerk at the table.

FIG. 8.—VIEW OF THE PLANT-HOUSES AT FALKLAND PARK, NORWICH. (SEE P. 39.)

presided at the annual and other public meetings of the Fund, and his loss will be severely felt. Sir JULIAN'S country residence was at Semerhill Park, near Tunbridge, a fine Tudor mansion, in the midst of delightful scenery.

**THE ROYAL HORTICULTURAL SOCIETY.**—We have received the following circular, to which we gladly give publicity:—"With the hope of encouraging individual effort and original research, the council of the Royal Horticultural Society offer Medals, Silver or Silver-Gilt, according to merit, for the following:—

I. INTRODUCED PLANTS.

- A.—The best Hardy Plant not previously shown at any of the Society's Meetings (Narcissus excluded)—Amateurs.

with record of parentage, &c., not previously shown at any of the Society's Meetings (Narcissus excluded)—Amateurs.

- H.—The best Hardy Plant raised in this country, with record of parentage, &c., not previously shown at any of the Society's Meetings—Open.
- I.—The best Stove or Greenhouse Plant (raised and shown by an Amateur), with record of parentage, &c., not previously shown at any of the Society's Meetings (Orchids excluded)—Amateurs.
- K.—The best Stove or Greenhouse Plant raised in this country, with record of parentage, &c., not previously shown at any of the Society's Meetings (Orchids excluded)—Open.
- L.—The best Orchid (raised and shown by an Amateur), with record of parentage, &c., not previously shown at any of the Society's Meetings—Amateur.
- M.—The best Orchid raised in this country, with record of parentage, &c., not previously shown at any of the Society's Meetings—Open.

**NARCISSUS COMPETITIONS—AMATEURS ONLY (except L).** Tazettae (Polyanthus Narcissus) excluded.

Exhibitors wishing to stage Narcissus foliage with the blooms may use that of commoner kinds.

None of the Seedling Prizes will be awarded unless the new variety shown is a distinct improvement in some way on any at present in commerce.

MARCH 24.

- A.—Six varieties of Narcissus, distinct, five blooms of each, grown in the open air without protection. 1st Prize, 10s.; 2nd Prize, 5s.
- B.—Seedling Narcissus, not yet in commerce, raised and shown by an Amateur, and not having yet received a Prize at any Royal Horticultural Society Show. 1st Prize, 10s.

APRIL 7.

- C.—Twenty-four varieties of Narcissus, distinct, five blooms of each. 1st Prize, £1 10s.; 2nd Prize, 15s.
- D.—Twelve varieties of White Ajax, distinct, not less than three nor more than five blooms of each. 1st Prize, £1; 2nd Prize, 10s.

E.—Twelve varieties of Yellow and Bi-colour Ajax, distinct, not less than three nor more than five blooms of each. 1st Prize, 15s.; 2nd Prize, 7s. 6d.  
F.—Seedling Narcissus, as on March 24.

## APRIL 21.

G.—Collection of Narcissus, not exceeding fifty varieties, distinct, five blooms of each. 1st Prize, Silver Cup; 2nd Prize, £2.  
H.—Eight varieties of White Ajax, distinct, not less than three nor more than five blooms of each. 1st Prize, 15s.; 2nd Prize, 7s. 6d.  
J.—Eight varieties of Yellow and Bi-colour Ajax, distinct, not less than three nor more than five blooms of each. 1st Prize, 10s.; 2nd Prize, 5s.  
K.—Eighteen varieties of Narcissus, Ajax excluded, distinct, not less than three nor more than five blooms of each. 1st Prize, £1; 2nd Prize, 10s.  
L.—The best stand of new Seedling Narcissus, not yet in commerce, raised from seed by the Exhibitor, not less than twelve varieties, distinct, not more than six blooms of each, and not more than one-third of the total number of varieties shown to be of the Ajax section—Open. Prize given by Miss WILLMOTT, £5.  
M.—Seedling Narcissus, as on March 24.

## MAY 5.

N.—Collection of Narcissus, not exceeding fifty varieties, distinct, five blooms of each. 1st Prize, £2; 2nd Prize, £1.  
O.—Fifteen varieties of Narcissus, distinct, Ajax excluded, not less than three, nor more than five, blooms of each. 1st Prize, £1; 2nd Prize, 10s.  
P.—Five varieties Narcissus poeticus, distinct, not less than three nor more than five blooms of each. 1st Prize, 10s.; 2nd Prize, 5s.  
Q.—Seedling Narcissus, as on March 24.  
R.—Extra Prize for the best Seedling Narcissus, raised by an Amateur, and shown at any Royal Horticultural Society's meeting from March 24 to May 5 inclusive, not yet in commerce, and not having received any Royal Horticultural Society award previously to 1895. Silver-gilt Flora Medal."

— We are requested to state that the publication of the Royal Horticultural Society's Rules for Judging is unavoidably delayed a week or ten days, owing to the unfortunate loss in the post of the final corrected proof for the printer, the week before Christmas. The loss has only just been discovered, and will cause a great deal of work to be done over again, besides the actual delay.

**LINNEAN SOCIETY.**—On the occasion of the evening meeting to be held on Thursday, January 16, 1896, at 8 P.M., a paper will be read:—I. "On the Flatose Polymorphitæ and the Ramalina," by Prof. T. ROBERT JONES, F.R.S., and Mr. F. CHAPMAN.

**NATIONAL ROSE SOCIETY.**—Committee meetings will be held on Tuesday next at 2 P.M. and at 3 P.M., in the rooms of the Horticultural Club.

**GEORGE WASHINGTON'S CYCAS.**—At a recent sale in New York, a plant of *Cycas revoluta*, said to have belonged to GEORGE WASHINGTON, was sold for 340 dollars. A figure of the plant is given in our excellent contemporary, *American Gardening*.

**BERLIN GENERAL HORTICULTURAL EXHIBITION.**—The Society for the Promotion of Horticulture in the Prussian States is preparing for a great exhibition in 1897, to commemorate the seventy-fifth year of its establishment. The General Secretary is Dr. WITTMACK, 42, Invalidenstrasse, Berlin.

**PARIS HORTICULTURAL CONGRESS.**—This will be held at the same time as the great exhibition to be held in May. The meetings of the Congress will be held in the "Hotel" of the society, Rue de Grenelle 81, at half-past 2 P.M., on Thursday, May 21, and following day. The Congress is open to members of any nationality, whether fellows of the society or not. The questions proposed for discussion are:—1, the grafting of Potatoes; 2, the apparatus to be employed for heating hot-houses with reference to the nature of the fuel made use of—wood, charcoal, petroleum, gas, &c.; 3, the part played by electricity in vegetation; 4, the influence of selection in making cuttings; 5, history and cultivation of Cattleya and Lælia; 6, summary of conditions favourable to vegetation; 7, choice of the most suitable trees for avenues in towns.

**PARIS.**—The great show of the National Horticultural Society of France will be held in Paris, in the garden of the Tuileries, from May 20 to May 25.

As the show opens one day later than the opening of the Temple Show, it will be possible to visit both exhibitions in the same week.

"**BOTANICAL MAGAZINE.**"—The plants figured in the January number of this famous periodical are:—

*Stanhopea Haseloviana*, Rehb. f.—A Peruvian species, with large cream-coloured flowers, thickly marked with ring-like markings of a reddish-violet colour. In the lip the spots are smaller circular and more deeply coloured; t. 7452.

*Dendrobium Hildebrandi*, Rolfe.—A Burmese species, with white flower-segments, and a primrose-yellow lip (see *Gardeners' Chronicle*, 1895, ii., p. 93); t. 7453.

*Alberta magna*, E. Meyer.—A Natal shrub, belonging to Rubiaceæ. The leaves are ovate-lanceolate glabrous, and the very numerous red tubular flowers are borne in much-branched loose panicles; each flower is about 1 inch long, clear red, narrow, tubular, with a small limb.

*Guzmania pygmaea*, Sander.—A native of S.E. Africa, with linear serrulate or nearly entire leaves, grey on the under surface. Flower-heads on long purplish scapes; ligulate florets, white, flushed with pink or blue.

*Asarum maximum*, Hemsley.—A Chinese species, with bold cordate leaves, and large, bell-shaped, three-lobed, purplish-brown flowers, with a cream-coloured centre. Described in our columns, 1890, vol. i., p. 422.

**SMITHSONIAN REPORT.**—We have received the Annual Report of the Board of Regents of the Smithsonian Institution, showing the operations, expenditures, and condition of the Institution to July, 1895. This bulky volume gives some idea of how considerable was the work done during the year in question; not only that work officially connected with the Institution, but also that relating to exploration and research. The general appendix, which occupies the majority of the pages of this book, will prove more interesting to ordinary readers. Among the subjects treated of may be mentioned the following:—"The Wanderings of the North Pole," by Sir Robert Ball; "Photography in the Colours of Nature," by T. E. Ives; "Photographs in Natural Colours," by Léon Warnecke; "The Problem of Flying," by Otto Lilienthal; "How Maps are Made," by W. B. Blake; "Field Study in Ornithology," by H. B. Tristram; "Deep Sea Deposit," by A. Daubrée, &c. This by no means exhausts the list of contributions, which is a very varied one, and well carries out its intended purpose, as described in the Report before us:—"It has been a prominent object of the Board of Regents of the Smithsonian Institution, from a very early date, to enrich the annual report required of them by law, with memoirs illustrating the more remarkable and important developments in physical and biological discovery, as well as showing the general character of the operations of the Institution; and this purpose has, during the greater part of its history, been carried out largely by the publication of such papers as would possess an interest to all attracted by scientific progress." Suffice it, then, to say, in conclusion, that this important book is a worthy representative, not only of the series, but also of the important body whence it is issued.

**A1 CAMPHOR.**—This is a Chinese product, obtained from a composite shrub called *Blumea balsamifera*, D.C., by distillation of the leaves. A full description of the process, together with an illustration of the plant, is given in the November number of the *Kew Bulletin*.

**COURGE PATATE.**—M. COBBEYON writes, "I am pleased to see in the *Gard. Chron.*, Dec. 28, 1895, p. 764, an appreciative account of the "Courge Patate" from M. NARDIN. I received some seeds of the plant last year from a friend at Montpellier, and my gardeners sowed and planted them without bestowing any extra pains upon them. When the seeds were ripe in a stray corner of the nursery which I have, my

head gardener tried some and found them delicious; he brought some to me, and they were tried cooked in various ways, and more particularly fried, and like Potatoes. This vegetable is delicious, and all who have tasted it consider it worthy of attention and extensive cultivation. The flesh, as you say, is firm and very good when cooked. I will add that when fried, they have a peculiarly delicate flavour resembling that of a Pumpkin, and which lingers long upon the palate."

**HORTICULTURAL CLUB.**—The usual monthly dinner and *conversazione* will take place on Tuesday, January 14, at 6 P.M. The subject for discussion will be, "Some Notes on the Arrangement and Furnishing of Rock Gardens," to be opened by Mr. H. SELLE-LEONARD.

**M. PUNAERT.**—Those of our readers fortunate enough to know M. PUNAERT, and they are not few, will bear with pleasure that he has been made a member of the Order of St. Stanislas of Russia. Our colleague, Mr. MARTINET, the editor of the *Paris Jardin*, has also received the same compliment.

**THE SCHOOL OF HORTICULTURE AT VERSAILLES.**—A bust of M. PIERRE JOIGNEAU has been placed in the garden of the Versailles School of Horticulture, of which JOIGNEAU was the founder.

**HYBRID POPPIES.**—Some doubt as to the existence of such hybrids has been expressed. At a recent visit to Verrières, however, we were assured by the raiser himself, and by M. HENRY L. DE VILMORIN, that such a hybrid had been raised there between *Papaver bracteatum* and one of the double-flowered varieties of *P. somniferum*. The seedlings were annuals, and bore single carmine-coloured flowers. At first the plants were nearly all sterile but subsequently seed was freely produced.

**MARCHESE HANBURY.**—H.M. the King of Italy has conferred on Commander HANBURY, of La Mortole, the title of Marchese, or Marquis. Our valued correspondent will henceforth be known as Marchese HANBURY.

"**THE ROSARIAN'S YEAR BOOK.**"—We shall have other opportunities of speaking of this little volume, but in the meantime we may indicate among its principal contents a notice of the career of Mr. ALEXANDER DICKSON, of Newtownards; a very interesting paper on hybridising Roses, by Lord PENZANCE; and Mr. MAWLEY's very valuable account of the weather and vegetation of the past Rose year.

**INSECT-CATCHING PLANTS.**—Mr. BURBIDGE has been delivering two lectures on this subject, under the auspices of the Royal Dublin Society, and which proved very attractive.

**A WINTER BOUQUET.**—Messrs. SANDER, of St. Albans, send as the materials for a very beautiful winter bouquet. It consists of two long spikes of hybrid *Calanthes*, which by their length and the slenderness of their stalks fall gracefully over the sides of the vase, whilst they are backed up by the somewhat stiff spathes of *Anthurium Saederianum*. The contrast of form is very striking. The *Calanthes* are *C. Bryani* ×, in which the flower segments are creamy-white, and the lip white with a reddish-purple blotch at the base, and *Calanthe William Murray* in which the segments are snow-white, the large lip white shaded with light rosy-purple, and with a deep purplish-crimson blotch at the base. Both these are seedlings from the garden of N. COOKSON, Esq. The *Anthurium* is in the way of *A. Andraeanum*, with large leathery, cordate-acuminate, puckered spathes of a scarlet colour, the two-rounded basal lobes bronzy-green. The way in which the scarlet colour passes gradually into the green of the base is very beautiful.

**THE BRISTOL AMATEUR HORTICULTURAL SOCIETY,** says the *Western Press* of the 7th inst., has now entered upon its third season, and in compiling the programme for the year the committee have abandoned their former practice of set lectures, and introduced some features which ought to prove

of interest to all amateurs, inasmuch as most of the subjects in general favour are dealt with at the time when attention should be directed to them. A large influx of new members is expected as the result, and there is every indication of a successful season. The first of the new series of meetings was held at Colston Hall, and the President (Mr. T. D. SIBLY) gave a New Year's greeting to a large number of members. Mr. G. WADE gave some interesting hints on the culture of the Chrysanthemum, and being the first of a series on this subject, his remarks were confined to the preliminary stages of treatment. He also gave some advice to those intending to grow Tomatos. Mr. W. J. POLLARD gave the plans and details of a scheme of hot-water propagators for amateurs, and dealt with the various methods in vogue. A paper on "Lilies" was also contributed by a member. The year's prospectus is of a comprehensive character, and the objects of the Society are kept well to the front.

**STOCK-TAKING: DECEMBER.**—An increase of some £2,153,000 in the revenue account for the quarter ending on December 31—an increase in the three quarters of the year of £6,100,000—to some extent prepared us for a favourable report on the Board of Trade Returns of imports and exports for the last month of the year now passed into history—in spite of an unquiet feeling respecting foreign relations, and a tendency to scenting villainous salt-petre in the air around us and abroad. But the laden atmosphere will, let us hope, clear up, and there is not a single decrease recorded in the month's list of imports, and a gain of £3,897,025, as compared with December of the year preceding. It may be noted also that the imports of 1895 show an increase over 1894 amounting to £8,342,820! The following are our usual extracts from the "Summary" table for December:—

IMPORTS.	1894.	1895.	Difference.
Total value of imports	£ 33,074,400	£ 36,967,505	+3,897,025
(A.) Articles of food and drink—duty free ... ..	11,030,331	11,672,910	+642,579
(B.) Articles of food and drink—dutiable	2,259,925	2,328,222	+68,297
Raw materials for textile manufactures ... ..	7,252,954	8,203,741	+950,787
Raw materials for sundry industries and manufactures ...	2,780,024	3,423,517	+643,493
(A.) Miscellaneous articles ... ..	1,155,569	1,315,159	+159,590
(B.) Parcel Post ... ..	48,239	68,922	+20,683

As we have said, there are no items under the heading "decrease"—the total value for the month being £36,967,505. As to fruit, roots, and vegetables imported in the past month, the following figures will interest:—

IMPORTS.	1894.	1895.	Difference.
Fruits, raw:—			
Apples ... .. bush.	723,951	398,019	−325,932
Cherries ... .. "	...	...	...
Plums ... .. "	50	...	−50
Pears ... .. "	16,123	5,588	−7,540
Grapes ... .. "	1,819	2,058	+239
Unenumerated ... ..	37,170	47,173	+10,003
Onions ... .. "	318,297	448,727	+130,430
Potatoes ... .. cwt.	160,291	33,595	−126,696
Vegetables, raw, unenumerated ... .. value	£ 55,181	£ 57,903	+2,722

The imports for the year demand separate notice at an early day—space will not permit of our doing so now. Turning to the—

**EXPORTS**

for December, we have a favourable report to make with a total of £19,179,535, or an increase of £1,678,953 over December, 1894, the total for the year being £226,169,174 (an increase of £10,314,841

over the year 1894). There are but two items under the "decrease" heading—one in raw material to the amount of £192,377, whilst the other is represented by £6,430; the items of decrease on the twelve months' account being in raw material, chemicals, and medical and chemical preparations—represented by the sum of £1,651,515.

**FLOWERS IN SEASON.**—We have before us a few blooms of seedling varieties of Chinese Primulas, raised by Messrs. JNO. LAING & SONS, Forest Hill, London, S.E. They are pretty, and the colours are distinct and good, varying from pure white to rich purple-crimson. In regard to size, no special remark is needed.

**GARDENERS' ROYAL BENEVOLENT INSTITUTION.**—A general meeting of the members of the Gardeners' Royal Benevolent Institution will be held at SIMPSON'S, 101, Strand, in the county of Middlesex, on Thursday, the 16th day of January, 1896, at 2.15 P.M., to consider and adopt partial alterations and additions to the existing rules of the Institution recommended by the Committee of Management. And the fifty-seventh annual general meeting of the members of this Institution will be held at the same place and on the same date at 3 P.M., for the purpose of receiving the report of the Committee and the accounts of the Institution for the present year, electing officers for the ensuing year, and other affairs; and also for the purpose of placing fifteen pensioners on the funds, five under rule III. 5, and the remaining ten by election. The voting papers have been issued. Any subscriber who has not received one should communicate with the Secretary, GEORGE J. INGRAM, 50, Parliament Street, London, S.W. After the annual meeting, the usual friendly supper will be held, also at SIMPSON'S, when PETER C. M. VERTCH, Esq., of Exeter, will preside. Friends who desire to be present should communicate with the Secretary at the above address.

**PUBLICATIONS RECEIVED.**—We have received the following:—*Transactions of the Massachusetts Horticultural Society for the Year 1894*, Part II., containing reports upon the work done, investigations undertaken, and exhibitions superintended during the time mentioned.—*Annual Report from the Botanic Garden, Grenada*, by Mr. W. E. BROADWAY. "The grounds, nurseries, walks, drains, and various cultivations have been maintained in as satisfactory a manner as can be expected out of the small annual vote set aside for this purpose." Mr. Broadway notes that "crabs still remain a formidable drawback, but do not reach the higher parts of the garden. By a method in use we have exterminated great quantities of them, yet 'still they come.' Their holes all about the entrances are numberless, each hole runs down into the earth until it reaches water, no matter at what depth, and digging down, one is sure to come across its inmate. Proving this, we have tried blocking up the hole, after inserting a mixture of food and poison, and found it efficacious. The garden site being a reclaimed swamp, with a lagoon a few yards off it, makes the prospect of exterminating them entirely an impossibility—one can only reduce the number from time to time. Human invaders are even harder to keep out. We read that barbed wire, which is used at the Botanic Garden for fencing, is so frequently cut by persons wishing to trespass, that it is proposed to strengthen it by a thick hedge of Governor Plum (*Flacourtia Ramontchii*) and other thorny and prickly plants. The report treats of the trees and plants of the garden, which are in a satisfactory condition and yielding well. Good accounts are given of the plantations of Cacao, Nutmegs, Liberian Coffee, Kola, Black Pepper, Eucalyptus, and other plants—in fact, 1894 seems to have been a fruitful and in all ways a satisfactory season.—Another publication lately received is the *Annual Report of the Gardens of His Highness Maharajah Fatah Singhji, G.C.S.I., of Oodeypore, for the Year 1894-95*. These grounds include a nursery, Rose-garden, vegetable and rock gardens, as

well as a deer park, menagerie, cricket-field, and other departments. All seem in a thriving condition, well managed, and in every way creditable to the superintendent, Mr. T. H. STONEY and his assistants.—*Bulletin of the Botanical Department, Jamaica*, November, 1895, edited by WILLIAM FAWCETT. The contents of this publication this month include papers upon the Orange Tree in Jamaica, Selected Yeasts, &c.; the Cultivation of Vegetables, Bermuda Lily, Synoptical List of Ferns (continued), and list of contributions to the department.—*The Journal of the Board of Agriculture*, Vol. ii., No. 3, for December, 1895. Among the contents this month we note papers on Evaporation of Fruit, Wages of Agricultural Labourers, Beet-sugar Industry on the Continent, Injurious Insects and Fungi, General Agricultural Notes, Imports of Agricultural Produce, and similar subjects.

**NOTICES OF BOOKS.**

**LES PALMIERS DE SERRE FROIDE, ETC.** (Greenhouse Palms). By Raphael de Noter. (Paris: Octave Doin, 8, Place de l'Odéon.)

WELL within the memory of middle-aged readers, Palms were a luxury of the wealthy; now they are grown under glass, one might say by the acre in some of the Belgian establishments as well as in some of our home nurseries. The result is, that they may be seen in abundance on the costermongers' barrow, and the most modest drawing-room has its Palm equally with the west-end boudoir. Equally perhaps, more marked has been the extension of Palm-culture in the Riviera along the Mediterranean coast. A quarter of a century ago, the Date Palm was almost the only Palm to be found on those shores, but now the forms are as numerous and varied as they are striking and beautiful, so much so, that the coast from Toulon to Mentone and beyond, is now one vast garden.

The little book before us is an excellent treatise, dealing with the climate and soil of the Mediterranean region, and then of the houses and appliances that are necessary for the raising Palms from seeds for their culture in a young state, and the care necessary for their transplantation. A descriptive list of the species suitable for cultivation in the south of Europe or in northern countries under glass is given, illustrated with woodcuts, showing not only the "habit" of the plants illustrated, but also the details of its structure. It is a most useful little book, forming an excellent introduction to more detailed and pretentious treatises.

**IN VERONICA'S GARDEN.** By Alfred Austin. (London: Macmillan & Co.)

This elegant little volume has been lying on our table for some little time, waiting its turn, till the pressure on our space should permit us to supplement our notice of its publication by more extended reference. Another reason for delay may be found in the fact that *Veronica's Garden* and the *Garden that I Love*, are pretty much one and the same, so much so, that he who has perused the one need not, unless he be so inclined, read the other. But the fact that, since its publication the author has become Poet Laureate, entails the necessity for a prompt notice of this his latest work. Elegance of diction, refined taste, and dainty fancy, are equally characteristic of this work, as of the previous one. Tennyson, in his early days, had pre-eminently caught the scientific spirit of the times in which he lived. He was a born naturalist, and numberless citations might be made in illustration of his feeling for natural truth, and even of his detailed knowledge. True, in later years, the hero of our younger days deserted his earlier faith, but that may have been the inevitable result of physical changes consequent upon advancing age. Whether this be so or no, it is pleasant to find in the new Laureate's book, if not the same grasp of the philosophy of natural history and development

that his predecessor had, yet an abundant love for those things that naturalists in general, and gardeners in particular, hold dear. What the author's views of a garden are may be gleaned from the following passage, p. 62:—

"A garden, to my thinking, is neither a museum nor a laboratory, a place neither for learned collections nor for ingenious experiments. I am deeply grateful both to the collectors and to the experimentalists, and I avail myself to the best of my ability of their needful labours, but only in so far as these subserve the supreme purpose of a garden, which is Beauty. Collecting rare plants, and growing specimen flowers, are something quite different from cultivating a garden. When I am shown so many square feet of Love-in-the-Mist, then a bare patch of soil, then some furlongs of Salpiglossis, then more bare soil, and so on, I am disposed to inquire if the flowers are grown for market, and am compelled to observe that the cultivation of them in this fashion is no more difficult than the cultivating of Radishes or the sowing of Carrots. They bear the same relation to a real garden that the words in the dictionary bear to a beautifully-written book. They are the materials out of which a garden may be made, but of themselves they do not constitute a garden. With the exception of the beds of Tea Roses and Violas, you doubtless observe that I expect almost every flower, due regard being had to height and colour, to flourish side by side with every other flower. I ask my flowers, the annuals as well as the perennials, not to be too exclusive, nor selfishly to demand a space all to themselves, but rather to be amiably sociable, to consort considerably with their kind, and, if necessary, which it often is in this world, to subordinate something of individual pretensions to the common good."

So, too, the memorable summer of drought, 1894, called forth all the energy of the gardener, and his labours are clearly reflected in the pages before us. This was the result:—

"I had no idea the garden was looking so lovely till they came and told me so, and told it with an effusion to which I am not accustomed. You see, I had been living and working in it day after day, contending with difficulties, and trying to ward off impending perils, and had, therefore, come to pay more attention to weak places than to strong ones, to be more vexed at supposed shortcomings than to exult over self-evident beauties. In ordinary times I am fully alive to the danger of cultivating overmuch the fastidious spirit, and of acquiring the habit of noting defects instead of observing merits. This is a foible I think in any occupation of life, but one easily falls into it if one is in pursuit of perfection."

We should like to quote some of the pretty verses with which the volume abounds, but we have not the space; moreover, to take them out of their setting would be to do them an injustice. Recent circumstances, however, give exceptional significance to the last few stanzas of the Christmas Carol, which practically concludes the book, and which, of course, were written long before the appearance of the war spectre:—

"But not alone for those who still  
Within the Mother-Land abide,  
We deck the porch, we deck the sill,  
And fling the portals open wide.

"But unto all of British blood,—  
Whether they cling to Egbert's Throne,  
Or, far beyond the Western flood,  
Have reared a sceptre of their own,

"And, half-regretful, yearn to win  
Their way back home, and fondly claim  
The rightful share of kith and kin  
In Alfred's glory, Shakespeare's fame,—

"We pile the logs, we troll the stave,  
We waft the tidings wide and far,  
And speed the wish, on wind and wave,  
To Southern Cross and Northern Star.

"Yea! Peace on earth, Atlantic strand!  
Peace and good-will, Pacific shore!  
Across the waters stretch your hand,  
And be our brothers more and more!

"Blood of our blood, in every clime!  
Race of our race, by every sea!  
To you we sing the Christmas rhyme,  
For you we light the Christmas-tree,"

The book is well got up and charmingly illustrated, the proofs have been carelessly read in places, but on the whole the work is one to be read with placid enjoyment and sympathetic assent.

**AUSTRALIAN GRASSES.** By F. Turner, F.L.S., F.R.H.S., &c. Vol. I. (Sydney: Charles Potter.)

The author has had ample opportunities of studying the grasses in their native localities, and has, moreover, grown upwards of a hundred of them experimentally. The results of this comparative study have shown the author that the indigenous herbage is better suited to the climate than many of the exotics which have been recommended for cultivation. Mr. Turner has not only put forth the botanical details which are of importance, especially to the botanist, but he has also given particulars relating to the mode of growth, and to the "habit" of each species. These latter details are often ignored—at least, to a great extent—by the botanist, who has to deal with herbarium specimens, mainly, or exclusively; but they are of pre-eminent importance to the cultivator and grazing-farmer. It is by a study of these points, rather than of systematic details, that the observer is able to form an opinion as to which grasses are the most suitable to particular localities, or particular requirements, and which are most likely to be victorious in the struggle with adverse conditions, competitors, or rivals. The illustrations are faithful, and therefore helpful. Each one should have borne a number for convenience of reference, and an index would be an improvement. The ligules, and the way in which the leaves are folded, need amplifying; but, on the whole, the work is excellent, and highly creditable to all concerned. *Sporobolus Lindleyi* would be quite worth while cultivating for decorative purposes.

**THE SILVA OF NORTH AMERICA:** a description of the trees which grow naturally in North America, exclusive of Mexico. By Charles Sprague Sargent, &c. Vol. VIII. (Boston and New York: Houghton, Mifflin & Co.)

The very important publication, whose title is above cited, has now reached its eighth volume. The regularity and promptness of publication are not the least among its many merits. This eighth volume is dedicated to the memory of André and François Michaux, pioneers in the knowledge of American trees. The entire volume is devoted to the Oaks of North America. First, we have a botanical description of the genus, with a brief history of the group in geological as well as in present times. The uses to which the trees or their products are put, the insects and fungi which attack them, and other incidental points are dealt with, and numerous interesting notes are added, notes which are so encyclopædic in their character, that in future, when any information is needed about Oaks, it is to this monograph we shall turn. We may note in passing, that the Fulham Oak is said to have originated in the Fulham Nurseries in Exeter (p. 7, note). This is of course a slip, and English readers would substitute London for Exeter. Then follows a conspectus of the American species, fifty in number, a conspectus only available when the observer has complete materials before him—a rare event, unfortunately. In this portion of the work, Professor Sargent follows in the main the arrangement proposed by the late Alphonse de Candolle. Each of the fifty species is described in detail, its history narrated, its peculiarities and uses set forth. More than this, each species is illustrated by plates, wherein without loss of effect, utility, and botanical accuracy are secured. To give an idea of Professor Sargent's work, we append the following quotation referring to the Red Oak, but omitting the description and the numerous notes:—

"*Quercus rubra*, which is the most boreal of the Oak-trees of eastern America, generally inhabits rich uplands, growing to a large size on glacial drift and the well-drained borders of streams and swamps. It ranges from Nova Scotia and southern New

Brunswick through Quebec, where it reaches the banks of the St. Lawrence in about latitude 47° 50' north, along the northern shores of Lake Huron to the neighbourhood of Lake Namekagon on the divide west of Lake Superior, southward to middle Tennessee and Virginia, and along the high Appalachian Mountains to Northern Georgia, and westward to Eastern Nebraska and central Kansas. Rare and of small size toward the northern limits of its range, the Red Oak is abundant in Nova Scotia, Southern Quebec, and Ontario; it is one of the largest and most common trees in the forests of the northern States with the exception of those which cover the mountains of northern New England and New York, and reaches its largest size in the States north of the Ohio River. Further south it is less common and usually small, and on the southern Alleghany Mountains it is exceedingly rare. The wood of *Quercus rubra* is heavy, hard, strong, close-grained, and liable to check badly in drying; it is light or reddish-brown, with thin, darker-coloured sapwood, and contains remote conspicuous medullary rays and bands of several rows of large open ducts marking the layers of annual growth. The specific gravity of the absolutely dry wood is 0.6621, a cubic foot weighing 41.25 lb. It is used in construction for the interior finish of houses, and in the manufacture of cheap furniture. *Quercus rubra* was introduced into Bishop Compton's garden near London before the end of the seventeenth century, and the earliest account of it, prepared from those cultivated trees, was published by Plukenet in 1692. Endowed with a constitution which enables it to withstand climatic conditions unlike those of its native land, *Quercus rubra* has succeeded in Europe better than any other American Oak, and individuals more than a century old may be seen in England, France, and Germany. No Oak of the northern States grows more rapidly or can more easily be transplanted, and few trees are better suited to ornament the parks and roadsides of the northern United States."

## THE CARNATION AND ITS CULTURE.

IN a paper read before the Massachusetts Horticultural Society on "The Carnation and its Culture," by Mr. Richard T. Lombard, a noted grower of these plants, the author stated that the Carnation by reason of its real merit, has, since 1860, rapidly forced itself into an important place in the flower trade of the Northern and Central parts of America, and that nearly 4000 florists are engaged either wholly or in part in growing this plant for cut flowers; and he estimated that fully 200,000,000 blooms are sold yearly in that country, yielding over 1,000,000 dollars to the growers. The great variety of colour, fragrance, beauty of form, and keeping quality of the Carnation have made it a decided favourite, and it may justly be termed the "flower of the multitude."

A flower of so much importance in trade, and one so generally loved by all who possess a garden, is certainly of sufficient importance for us to give it careful study. We gladly, therefore, avail ourselves of the valuable information afforded by Mr. Lombard's excellent paper on the Carnation as grown in America, and also of various facts obtained by the writer from Mr. Martin R. Smith, of Warren House, Hayes, Kent, and from Mr. C. Blick, the gardener at Warren House, to whose courtesy he is indebted for permission to use the results, which will be referred to in the course of this article.

The wild species of the Carnation from which our cultivated varieties were derived is *Dianthus Caryophyllus*. At the time of its introduction into England, its prevailing colour was a very light shade of pink—or more properly, "flesh-colour;" and from this fact it received its name of "Carnation." There is no doubt that, under the influence of English soil, climate, and culture, its colour became darker, and we find a few years later it was called "Pink."

The wild Carnation was single, having but five petals, and its native habitat was extremely limited, being found only in parts of France, Italy, Austria, and in the north-west parts of India, and always upon high, well-drained lands, where limestone was found. It has never been known to thrive in its wild state, except near the habitation of man. The

general construction of the plant, and the character of its foliage, are such, that it withstands drought wonderfully, and recovers from it rapidly when water is supplied.

From one or more of the places named, but more probably from Italy, the wild variety has been naturalised in various countries, and more particularly in England; but wherever naturalised as a wild plant, it has only succeeded in limestone districts, or near old buildings, and on well-drained soils. As we know the plant, it clearly shows the climatic influence of Southern Europe.

The peculiarities of the Carnation are such, that under cultivation it has taken almost any character, as to colour, or form, or flower, which the careful cultivator has desired. It has been popular in one generation, and unpopular in the next. When it was in favour, the flowers were increased in size, and the varieties were numbered by hundreds; and when the "Carnation fever" abated, it quickly lapsed to its ordinary size, and the varieties were few.

and upward in development, by the well-established law of evolution, until we have the perpetual varieties of to-day. And it is a matter of history, that this development has been brought about by the careful and intelligent labour of such men as Fairchild, Hogg, and Dodwell, in England; Schmitt and Alegatière, in France; and Sewell Fisher, Charles T. Starr, and others, in America—all have contributed to the result, and the credit is not due to any one in particular, but each is entitled to a share of the honour.

Between the years 1860 and 1870, floriculture took a great start in America, and especially around Boston, and between these dates it is believed that importations of Carnation plants were made, chiefly from France. The importations were of the varieties called Perpetual, and from the time of their introduction, the old half-hardy varieties seem to have almost disappeared.

The first varieties sent to America were La Purité and Edwardii, and a little later President

pleasing effect to the eye. Any flower whose petals grow well above the calyx before expanding is not likely to burst the calyx."

The plant should be vigorous, strong, healthy, freely branching, from 2 to 3 inches from the soil; foliage of a rich blue-green, and not over one-fourth of an inch in width; flower-stems well branched, giving a stem to each flower from 8 to 12 inches long, and with sufficient strength to hold the blooms erect.

The Carnation will succeed in any ordinary soil; from light, sandy loam to a firm clay. It prefers a fairly rich loamy soil—well-rotted turf with one-fourth its bulk of old manure, with a bushel of air-slacked lime, and a bushel of hard-wood ashes to every two loads of soil. Mr. Lombard finds the following formula the one best adapted to growing Carnations: He cuts and places on the ground a layer of good sod or turf, face down; upon that a layer of hard-wood ashes, over that coarse gravel he puts a layer of well-rotted horse-manure, and lastly, a layer of air-slacked lime. The proportions of the materials are three parts sods, one part of manure, and one-fiftieth part of ashes and lime, one-half each. If the turf is from a clayey soil, horse-manure is recommended; if from a light, sandy soil, cow-manure. The whole history of the Carnation shows that it is fond of lime—this is a very important point.

Turning now to the practice and experience of Mr. Martin R. Smith in Carnation culture, he says: "Fresh loam, top spit; nothing in the world can beat this for Carnations." Alas, he states, "I find in growing Carnations in the border, that after planting them in a bed of fresh virgin loam they grow splendidly, but if I attempt to grow another lot of Carnations next year in the same soil they do very badly, and are not worth growing. This shows that the first lot have taken some properties out of the soil that are essential to obtaining the best results."

Mr. C. Blick, in reference to the same subject, says, "One thing is certain regarding the Carnation, and that is, it thrives and does better in every way in new soil. No matter how much horse or cow-manure is put into the soil the second year, we do not get such a good result, showing clearly there must be something the Carnation takes from the new soil that cannot be obtained in any ordinary manure; in fact, the Carnation will do better with less than a quarter of the manure the first year. If the true cause of this could only be got at, or in any way worked out, it would prove a boon indeed, and would be a great saving in every way." J. J. Willis, Harpenden.

(To be continued.)

FIG. 9.—VIEW IN THE GARDEN OF C. H. GOLDING-BIRD, ESQ., MEOPHAM.

At one time fringed petals were sought for and obtained, and at another time, smooth-edged or "rose-leaved" petals were wanted; and this desire was gratified. The gardeners of 200 years ago thought the flower imperfect if it did not split its calyx, and on refractory flowers the knife was used on the calyx that did not burst. But for the last 150 years great effort and care have been taken to prevent the bursting of the calyx, which to this time has not been wholly successful.

From the earliest cultivation of the Carnation to about the year 1810, this plant was entirely grown from seed, or propagated by layers. At this time a new system was begun, the propagation by cuttings; the only difference in this work between then and now, is that the growers of those days obtained bottom-heat by the same method we use in preparing our hot-beds, while we use steam or hot-water pipes, or a flue.

It may be stated that the seed of the Carnation of long past ages contained the latent power which, for more than 600 years, by culture, selection, hybridisation, and crossing, has marched onward

Degrand and Crimson King; these formed the foundation of those now grown.

In the States of America, from that time, the interest in the Carnation has been on the increase. New varieties are grown from seed, and the chances of getting one equal to or better than the parents is estimated to be as 1 to 500. Mr. Lombard is fully convinced that no advance can be made in the Carnation, without taking the best types for parents, and giving them the best possible conditions. Very rarely can a good variety be obtained by chance, for, as a rule, in this as in everything else, hereditary influence and environment will impress the new plant, and if success is sought—these must not be disregarded.

Mr. Lombard's idea of a first-class Carnation flower is thus expressed:—"It should be symmetrically formed; its petals fringed or serrated, and of good substance; if a self, the colour should be evenly distributed throughout its petals; its calyx non-bursting; it should be fragrant; its centre full, well-raised, yet not crowded; and it should measure from 2 to 3 inches across—the whole flower giving a

## AN AMATEUR'S GARDEN.

FORTUNATELY our island abounds with gardens—of limited extent very often; they are not the less enjoyable, and many are the hours, at almost all seasons, in which the owner, who happens also to be an amateur in gardening, can devote to his plants, getting more and more interested in them as time goes on. It goes almost without saying, that an amateur must be an observant person, otherwise he would run near to lose half the pleasures of his garden, besides doing irreparable injury unwittingly to his plants. If he have water in the form of natural ponds, or ponds made natural-looking, an artificial basin, or a brook, he can indulge in many fancies of a piscatorial nature, or when trees and bushes abound, as they naturally will in a well-planned garden, Nature's choristers will seldom be long silent. And to ensure increase in the numbers of the song-birds, he has only to give strict orders in regard to nesting, always having regard to the sparrow population, that it does not increase over much. But he must protect all jackdaws, jays, owls, hawks, and rooks, very useful in their various ways as vermin-destroyers—although our friend the game-keeper thinks differently. The larvæ and insect-eating small birds should receive protection also. In the garden of C. H. Golding Bird, Esq., Pitfield Cottage, Meopham, Kent, the subject of our illustration

(fig. 9, p. 53), our readers will, we believe, think that this gentleman, as an amateur, will be enabled to find much pleasure and amusement, together with no little bodily exercise of the right kind if he desires it.

The mounded-up tree in the middle distance, and the banked shrubbery on the left, suggest an alteration of level in the small lawn; and evergreen and deciduous shrubs, doubtless flowering ones, appear in orderly confusion beyond, with just a glimpse of an arched opening through a tall hedge still further off. The trees on the right suggest Apples; and the walk, probably the chief one, is broad and nearly straight as befits its importance.

### PROPAGATION OF FICUS ELASTICA.

It may be of interest to some of the readers of the *Gardeners' Chronicle*, to describe the way this plant is propagated in Belgium. The results obtained are so encouraging, that it is almost a duty to give publicity to the method. The season when propagation is begun, is the end of the month of October and early in that of November, and the best plants to select for the purpose are those in which the vegetation has for the present stopped or slackened. Any plants which were planted in the outside-beds and taken inside in the month of September, will furnish an especially good stock of cuttings. The tops of the plants make nice plants with large leaves on the surface of the pot directly they are rooted, making therefore the best cuttings. The stalk is cut down to the part where its substance becomes too hard to be likely to emit roots, every portion having two leaves representing a plant, which will develop from the eye at the base. When cutting the india-rubber plant, make use of a very sharp knife. The cutting should be cut obliquely half an inch above the extreme eye, and the leaves of the part which are covered with soil should be removed; the base must be incised round. These "bleeding" parts are inserted forthwith into charcoal-dust, in order to arrest the flow of the juice, and when this stops, they are put under a hand-light in the propagating-house for two or three days. When they get flabby the leaves are rolled round, or the upper half of the leaves is taken off, in order that the cuttings may not occupy too much space, and avoid damping.

Every cutting is placed in a deep thumb-pot with sandy leaf-mould, pressed hard. The surface of the soil is left rough. These pots are then plunged in coal-ashes in a case in the propagating-house, with 25° to 28° Centigrade (80° Fahr.) bottom-heat, and covered with a layer of coal-ashes 1 inch deep, well watered, and the light placed over them. In six weeks or two months the cuttings will all be rooted, and it is very curious to see the numerous roots running on the top of the ashes. When the buds begin to open, it is time to pot them in small 60's, using two-thirds leaf-mould and one-third loam; replace the plants in the coal-ash bed, and close the light. When the plants have pushed roots through the soil, remove them out from the case to the front stage near the glass.

At the end of May or beginning of June, these young plants are planted at a sufficient distance apart to allow of good development in soil upon a hot-bed which has been used for other purposes, and still has a moderate degree of heat. Here they remain for the summer months.

The mild bottom-heat and the fertilising products of the bed, together with regular watering during the hot weather, enable splendid plants with a dozen or more large leaves to be produced by the month of September, at which they must be potted in 48's or 52's, according to strength. The cuttings made from the tops will make specimen plants, as they become in one year almost too tall for the usual saleable plants. *Louis Gentil.*

[*Apropos* of this subject, it may be mentioned that, cuttings taken from strong plants which have been introduced into a strong heat for a few days, so

as to induce a beginning of growth, in the months of January and February, and simply laid on a pan or tray filled with coarse, clean sand, in a temperature of from 63° to 78° of warmth, and frequently syringed or sprinkled, will emit perfectly healthy roots, and it will not matter in the least if the butt-end of the cutting touches the sand or not. The higher the temperature the more syringing. Under this kind of treatment, only such cuttings fail as are not suitable, and which yet the gardener may not care to put aside. Plenty of roots having formed, potting-up may be done, using finely-sifted compost of loam, leaf-mould, and sand, dribbling it in amongst the very tender roots, and not pressing it much, but shaking it down. Afford water, and keep in a close case till the roots push freely, when they may be removed and treated as above described. En.]

### SOME ANNUALS AT BRAYFIELD.

LAST September I walked round an old garden; its venerable proprietor told me it was at least 200 years old. There were two oblong plots about an acre each in extent, bounded by a 10-foot wall. Borders, 5 yards wide, run by the walls, and 5 feet asphalted paths, tile-edged, enclose the oblong beds, but a wider path traversed the centre, leading from one garden to the other; it is here the chief display was. About 5 feet from the path on both sides was a row of espalier Apples, forming a background to the flowers, Hollyhocks, and Dahlias. Then there was a brilliant display of annuals, of three kinds only, double Zinnias, Asters, and Stocks. What a variety of colours! and the Zinnias were splendid—many of the flowers 4 inches across, of dazzling colours, and beautifully imbricated; one grand flower in the centre, and a dozen smaller, nearly of the same height. Like most flowers with a predominance of reds and yellows, the Zinnia has no blues; but the shades of crimson, scarlet, magenta, pink, orange, primrose, and white are almost interminable. The flower lasts a considerable time too; the petals being of great substance, and lying flat, are but little exposed to the wind and rains.

Next to the Zinnias come the Asters, which have improved so greatly of late years; and here, fortunately, there is blue of many shades—selfs and fancyes, as the florists say. The Aster is a capital flower for the young amateur to commence with. The Crown Asters, those with a white centre, are charming—so, indeed, are all the tribe: the incurved, the reflexed, and the Anemone-flowered. The Asters which formed the second row below the Zinnias, were what the reporters would call a "beautifully even lot," a mass of bright colours, relieved here and there with snow-white blooms. In front of the Asters next to the path were the deliciously-scented Stocks, none the less charming from their profusion of bloom and lax habit. The individual flowers were double as Roses, and in several shades of crimson and blush. Then came the purples, then the faintest lavender-coloured ones. The dear old Brompton Stock; what has become of it? Well do I remember its great spikes of deep-red bloom in its glory, just in early June, when white Pinks are flowering, and the buds of Cabbage Roses are opening.

Brayfield Gardens are well worth a visit when these long borders are covered with such a wealth of glowing colour. The gardens kept by such an experienced manager as Mr. Nichols, are in excellent order. "Then you sow early?" "Yes, in frames, February; prick-off and harden in boxes under lights." There are scores of other annuals suitable for display in the garden, but none that I have seen so effective as the above kinds, and as if of them should be included in the orders now being prepared for the seedsmen. It is a singular circumstance that the commonest of all the annuals grown in the flower garden, or rather cottage garden, is the homely Nasturtium which, according to the nurserymen's catalogue, produces novelties every year, but as with the scarlets and yellows, we are met with the mystery that bars the blue. Those grimy London

streets! What a relief and charm it would give them if each occupant bought a pennyworth of Nasturtium seed and planted it in a box or pot and placed it on the window-sill! Something to cheer the heart when looked at from within, and rest the eye as its streamers waved without. How much could be done towards cheering and beautifying London streets by the outlay of a few pence on flowers or flower-seeds! I often think of the old shoemaker, who metamorphosed his little back-yard into a charming garden, 12 feet by 9 feet. Walls north, east, and west lime washed, a little boxed-in bed at the foot. Then sixpennyworth of seeds, Nasturtium, Convolvulus major, Scarlet Runner Bean, Tropæolum peregrinum, the Canary creeper, Cuscuta scandens, and a patch of Sweet Peas, and an extra pennyworth of Mignonette. Here my old friend would sit to smoke his pipe in the summer evening, starting up suddenly now and again to train a rambling shoot or pick off a dying blossom. *T. W. H.*

### HOME CORRESPONDENCE.

THE ROYAL HORTICULTURAL SOCIETY.—I do think something might be done, amongst other things, to enable Fellows to attend the Royal Horticultural Society's meetings at less expense; the railway companies meet other societies, and no doubt they would ours, if the powers that be would take the trouble to approach them on the subject. Gardeners who would be only too glad of the chance to see something more than is grown in their own neighbourhood, invariably give the expense of attending the meetings as a reason for not joining the society. I certainly think they might be given the chance of, at the least, seeing the Temple and Crystal Palace shows. *H. J. McDonald.*

The thoughtful letter of "A Fellow," recently in the *Gardeners' Chronicle*, suggests a few more observations, which I would like to add to my former remarks. First, then, I would suggest that unless the proposed provincial committees are likely to popularise the Society, extend its usefulness, and augment its funds, especially the last, the Society had better drop the idea. Secondly, I do not see the need of having a committee in every county; there would be danger in making them too common. Third, given responsible committees in a few centers, let them have as full power to bestow awards as the central committee where the funds of the society are involved—as in the case of medals, for example; such awards might take the form of a recommendation to the Council, but any "second fiddle" business to other committees would not, I think, be tolerated by any judiciously-selected, self-respecting provincial committee, and that such committees can be got together equal in any respect to London committees, I have no doubt whatever. "A Fellow" fears the Society's awards being made "too cheap and abundant." I rather think the proposed committees would keep a check on one another, and at any rate I can assure your readers that many of us provincials have long thought that the London committees bestowed awards without much discrimination or judgment. I have not the latest lists in my possession of the awards given during one year by the Royal Horticultural Society, but I have one before me only a few years old, of the awards given by the Royal Horticultural Society, the Royal Botanic, the Auricula, the Carnation and P.cotee, and the Dahlia Societies, amounting together to about 350 for one year, of which over 200 belong to the Royal Horticultural Society, all, or mostly all, "First-Class" (F.C.). The committees have been specially "weak" on Begonias, Chrysanthemums, Dahlias, and mere varieties of other things. It would be interesting to know what has become of most of the subjects that have never been heard of since, or which having been tested, have gone to the rubbish-heap. One example will suffice, for a committee that will make one gross blunder will make many. In the year I am writing of, the Strawberry Noble was awarded a First-class Certificate, which led many gardeners to give it a trial, only to find that it was probably the coarsest and worst-flavoured Strawberry ever raised, an indifferent cropper—to be discarded as soon as tried, and expunged from catalogues, or only put in at the tail end of lists, and all reference to its taste suppressed. I gave it a good trial, and saw it elsewhere, and in

my case it was not only coarse and bad in flavour, but positively nasty. It had only one recommendation—the blackbirds and thrushes shunned it while anything else was to be had to eat. I said at the time, and I shall always believe, that the persons who bestowed a First-class Certificate on that Strawberry, did not know a good Strawberry from a bad one, or did not care. The only difficulty, I fear, is the getting up of committees of private gardeners, nurserymen, and market gardeners of sufficient experience, and free from pre-conceived ideas and prejudice. Fruits, flowers, vegetables, and arboriculture should be represented, and they should certainly be members or associates of the society. How are these branch committees to understand the nature of the standards set up by the central committees? asks "A Fellow." "What is to hinder them, I rejoin?" I am curious also to see the standard that certificated "Noble" and all those mediocre Dahlias and Chrysanthemums, &c., without any means of comparisons of existing varieties or other data. *J. S. W.*

#### GOOSEBERRY CULTURE FOR EXHIBITION.—

The decline which is sometimes perceived in the cultivation of certain flowers once very popular occasionally extends to fruits, and it is noticed that the Gooseberry is much less cultivated for exhibition purposes than formerly in some of the north Midland counties. Recently I had occasion to enquire if there were any Gooseberry growers in the Rochdale district of Lancashire, and was informed on reliable authority that the propagation of Gooseberries by cuttings in that district had become difficult of late, the atmosphere being so vitiated that the plants make but very little growth. The propagation of the large show Gooseberries is now in the hands, it is thought, of very few persons, the principal growers being Messrs. C. Leicester & Son, Park Lane nurseries, Macclesfield, and Mr. J. Salisbury, Darby, though there are doubtless others who propagate on a smaller scale. The *Gooseberry Growers Register*, an annual publication, is still issued by Messrs. C. Leicester & Sons, Macclesfield. The issue for 1894 contains reports of forty-eight shows, held in Cheshire, Lancashire, Derbyshire, and Yorkshire; but its lack of bulk, compared with former issues, shows that exhibitions of Gooseberries are falling away. This publication has been in existence since 1809, and probably the first compiler of these records was a Jacob Wolstencroft, of Clifton, a place about half-way between Bolton and Manchester; and afterwards conjointly with Thomas Whittaker, of Blackley, near Manchester, and at the death of Wolstencroft, Whittaker took over the responsibility of compilation and publication. In later days, assisted by the late Mr. Samuel Barlow, of Stakehill, at Whittaker's death, the *Register* passed into the hands of Messrs. C. Leicester & Sons, Macclesfield. It is to be feared on some grounds that a Gooseberry society for Lancashire no longer exists. There was formerly a large Society in Manchester which met at the "Falstaff" inn, in the Market Place, and the meetings were attended by many of the leading growers in Lancashire and Cheshire, and probably came from Derbyshire and Yorkshire. From the "Falstaff" inn the meetings were carried to the Botanical Gardens at Old Trafford; but there is no mention of an exhibition there in the *Register* for 1894. Gooseberry growing for pleasure is, therefore, suffering a decline in the Manchester district. Formerly there were a great many growers at Prestwich and Whitefield, but scarcely one is known at the present time; and yet Gooseberry growing and exhibiting had social aspects of a very interesting and valuable character. I have heard my lamented friend, the late Samuel Barlow, recite most amusing incidents that happened at Gooseberry shows; and having a keen sense of humour added to a retentive memory, he was able to entertain a circle of friends for hours together with his droll reminiscences. Mr. J. Percival, of Smithy Bridge, tells a good story of "Owd Jemmy Crompton," the appellation by which he was known among "Fayberry" growers. He was a grower of considerable repute, and resided at Hodge Lane End. In those days manure was not easy to obtain, and he was a hand-loom weaver, with little money to spare, but as large Gooseberries cannot be produced without manure of some kind, "Jemmy" made a practice of gathering horse-droppings from the streets, conveying them to his garden in his hat, using the precious hatfuls as a top-dressing for his Gooseberry bushes, which rewarded his attentions by remarkably fine fruit, as the records of fifty years prove. Alas! with the Tulip, Polyanthus, Ranunculus, Auricula,

and other whilom popular flowers, even the big Gooseberry is on the down grade, and more is the pity. *R. D.*

**FLOWERS AS FOOD.**—Not the least refreshing experience of these holiday times was the fresh and sparkling article on the above by Mr. P. L. Simmonds, F.L.S., pp. 762, 763, of *Gardeners' Chronicle*, December 28. We are so accustomed to admire flowers for their beauty, or value them for their fragrance, that it is well at times to be informed of their vital usefulness in the arts and sciences, and their value for eating. Humiliating as the admission may seem, it was on this utilitarian side that the admiration of most of us for the flowers began. Most green leaves and beautiful flowers within our reach were tested and tasted for food, such as Rosebuds and leaves, Violets, Primroses, Cowslips, Berberis, Beech, the crisp growths of the Scotch and other Firs, Wood Sorrels, &c., with berries and nuts, hips and haws in all stages of development, from flowerhood to maturity. The experience reaped from this omnivorous consumption of all manner of greens and gays in our childhood sufficed to satisfy most of us for the remainder of our lives, to say nothing of those poisoned outright through Deadly Nightshade and other poisonous plants and flowers. But because most of us may have eaten flowers to our suffering or sorrow before we had acquired sufficient experience to choose the good and safe, and reject the dangerous, this can hardly be accepted as a logical reason for refusing or neglecting to eat them afterwards. And, in fact, we are a nation of flower-eaters to the tune of many thousand tons a year; for what are our Cauliflowers but arrested flower-huds, destined to a higher development in our muscles, tissues, brains—rather than to bloom on the land. And besides, are not the baby flowers of all the Cabbage tribe taken at the flood of highest quality, the very cream and marrow of this wonderfully versatile and useful family? We still also eat other flowers besides those of Cauliflowers and Broccoli, and might with pleasure and profit eat many more raw, cooked, pickled, glazed, to say nothing of the hundreds of fresh flavours that flowers could give to other foods. The age, whatever its other merits, is weak in condiments. Perhaps it would be more correct to say that its condiments get into its literature and not into its food. A more striking illustration of this could hardly be cited than in the shrinkage of herbs and fragrant flowers in so many gardens, and the almost total disappearance of the common yellow Marigold from the homes of the poor as well as those of the rich. Within living memory hardly a cottager's garden would have been considered properly furnished without these Marigolds, for beauty and use alone. They are almost as rare in gardens as the common lilac *Crocus*, which centuries ago gave its name and sustained an important industry at Saffron Walden. It is sad reading in these days of agricultural depression to be told that our imports of Saffron in 1892 amounted to £60,272, and in 1893 to £56,614. The imports of Saffron into India, where its flavour and colour have rendered it exceedingly popular, often exceeds £75,000 a year. Nor do these figures represent anything like the commercial value or profits of saffron-growing. Only the stigma of the *Crocus* is used in making saffron; and it is said that 70,000 stigmas are required to make a pound, and these have all to be picked by hand, a labour-making industry of fruitful character. Mr. Simmonds' other statistics are equally startling and striking, and must do much to raise flowers to a higher level as food and condiments. Those familiar with the innumerable food uses to which the flowers and young fruit of the Maize or Indian Corn are devoted, will be least surprised to hear how the flowers of the Banana are regularly eaten in India and pickled in China; and that 100,000 tons of Bassia flowers are consumed annually in India, the corollas being eaten raw as they fall from the trees, and those of other species dried, roasted, and boiled into jelly. From one city port in China alone, in 1893, 73,000 cwt. of flowers were shipped! Very glad to find that Mr. Simmonds, while revelling in the tropical stores of flowers as food, also notes the young seeds of the common Nasturtium, the most perfect of all known substitutes for Capers. It may, perhaps, have escaped his notice that the flowers of the Nasturtium are better eating than the seeds, and that the young and tender leaves are admirable in salads, or between bread-and-butter. The leaves, flowers, and fruit of the Canary-creeper are also good, though not equal to those of the common Nasturtium. The young flowers of the white Acacia, the Robinia pseud-Acacia, and some others, are also good eating dipped in paste

and fried in butter; or these may be packed in a pie-dish, and covered with crust, and presented as Acacia-pie. The flowers of most Sorrels in a young state are better to eat than the leaves; the same is true of Rhubarb and Seakale, if taken at the time of fullest crispness and flavour. The flowers, under-leaves, and shoots of Laurels [*Caution. Eo.*], Bay, Peaches, Nectarines, Plums, Apricots, as well as the flowers and young fruits are admirable substitutes for the flavouring of Almonds; and Lemon, Orange, and Citron blossoms and young fruits are excellent for similar purposes. The leaves and flowers of the Mock Orange can hardly be distinguished from Cucumber—a curious and very unexpected coincidence. Tender leaves and blossoms of Peas can hardly be distinguished in soups from the choicest early green Peas. Cucumber blossoms, when clean, young, and tender, add colour as well as refined flavour to salads. Finally, those who relish Grapetarts should not waste a single bunchlet, but cut them early, and cook them whole, placing a few in full flower over the others before covering with crust; the odour and flavour will exceed belief, unless to those who have already tasted the flavour of Vine flowers against Limes, perhaps our nearest approach to it. *D. T. F.*

**DOUBLE GROWTH ON AN ORCHID.**—The engraving published in last week's issue of the *Gardeners' Chronicle*, January 4, p. 13, of a double growth on a *Lælia* is really that of a *Cattleya Mossie*. The plant is in Mr. Walter C. Walker's collection at Percy Lodge, Winchmore Hill. When the growth started, it was rather larger than usual, and after it had grown about an inch it divided into two growths, as shown, and now each growth has developed a sheath. Those gardeners who have seen it say that they have never before noticed a similar occurrence. If the plant should develop two leads again, or only one, I will send you the information in the spring. A photograph of this abnormal growth was sent to the Scientific Committee of the Royal Horticultural Society, October 15, last year, and was noted in the *Gardeners' Chronicle* on November 2, 1895, p. 526 *Geo. Cragg*.

**TOMATO FROGMOLE SELECTED.**—As most gardeners will soon be making out their seed orders, I feel sure they cannot do better than purchase seeds of the above variety. I had it in cool Peach-houses and outdoors last season, and it fruited very well, each plant trained as a single cordon, carrying many bunches of fruit, to the average number of ten, of large and even shape. The flavour is excellent. *L. Mayne, Bicton.*

**TIMBER v. GAME.**—We are told by your correspondent "S. The Woods," on p. 654, last vol., that keepers never have a sufficient number of pheasants, that their system of hatching is so deplorable, and the mortality so great, that only one or two birds to every dozen eggs are brought to the gun. Now, if the game is as scarce as the covert shooting as "S." would have us think, it must be more scarce after it. How then does he account for the large numbers of early eggs (to say nothing of the late ones) which he assures us are gathered every year. The *multum in parvo* of it is, that he would have the keepers placed under the foresters, but the absurdity of the idea must be patent to everyone. We agree with him that employers expect their woodmen to know their business; they also expect their keepers to know theirs, and both have equal influence in their respective departments. No keepers of average competence buy eggs. They have their aviaries, or are able to obtain plenty from the covert. These are hatched and reared upon principles far in advance of those practised some years ago, and average twelve birds from fifteen eggs, more than two-thirds of the number reared being shot regularly each year, still leaving the covert well stocked. With regard to "S.'s" avowed ability to permanently crowd coverts with wild game, that would depend upon what his opinion of crowding is. He does not tell us what he considers good sport, but at its best it would be but a name if hemmed-in by hard-and-fast rules. I contend that when the early eggs are hatched and reared according to the above statements, and the pheasants continue laying, as they invariably do until they have as many more which they hatch, that the present system is very superior to his proposed one, in which they would lay only about half the number before becoming broody. Besides this, it is impossible to protect them in woods, while young, from the depredations of the foxes. As to keepers being rammed in

their duty to kill rabbits, it is sheer nonsense, unless "S." alludes to the Jack-of-all-trades class of men, among whom we do occasionally find woodman dabbling to some extent among the prolific conies, or game-keepers keeping estate fences and woods in order. We all know that those of that type are not proficient either in their own business or that of others. *Gams.*

**MORELLO CHERRY-TREES AT SCONE AND CULLEN.**—I have seen in the *Gardeners' Chronicle* lately, remarks on the Morello Cherries in Scone Palace Gardens, and as a worker at that place I thought them at the time very remarkable, and that no such trees existed in all Scotland. But to my surprise, when I went to the gardens of Collen House, Banffshire, I found Morello Cherry-trees much superior to the Scone trees; much larger, as healthy as those, more fruitful, and with finer fruit. These trees were well trained, but not on the same system as those at Scone. Mr. Dodd's system was to nail all the leaders first, and the smaller shoots were in all cases laid-in on the upper side of the branches, no shoot being allowed to grow below them. *A. Donaldson, Mickleham.*

**FICKLENESS OF PEARS.**—Some of these, that are invariably well-flavoured in some localities, are, when grown here in the heavy, cold soil of the kitchen garden, by no means to be relied upon. The late summer, however, which proved too tropical in its character for the good of many early varieties, produced a marked improvement upon late ones. The kinds that were most benefited were Glon Morceau, Bergamotte d'Esperen, Olivier de Serres, Easter Beurrié, and Beurrié Rance. The last-named is in season at the present time, and I do not remember it being previously fit for dessert here. The influence of the weather and soil in which they are planted has a remarkable effect upon Pears. So variable and particular are they in their requirements, that would-be planters may well be reminded to take the somewhat hackneyed advice of ascertaining what varieties behave satisfactorily in a neighbourhood before they plant there; and they may with advantage go further in this direction, and make certain what aspect, &c., especially upon walls, suits particular sorts. Taking varieties collectively, however, and the weather on an average, it is best to plant the latest kinds in the warmest positions, and the others accordingly. To illustrate the fickleness of this fruit, it may be noted that this season, Marie Louise, from an east wall, was better-flavoured than finer fruit of the same variety from a west wall. Beurrié Diel, Beurrié Hardy, Doyenné de Comice, Triomphe de Vienne, Conseiller de la Cour, were better from pyramids than from trees on walls. D'arondeau and Beurrié Boac, better from walls than from pyramid trees; while Beurrié Superfin and Souvenir du Congrès were worthless from a south wall. Although all the space usually at command upon south walls can, as a rule, be better utilised than by planting early Pears upon it, some of these, nevertheless, in cold seasons particularly, are excellent when thus favoured. Owing to the hot weather, early kinds kept badly, but its effect in this way upon late varieties is not so marked. *Thos. Coomber, The Hendre, Monmouth.*

**NOVELISTS' FLORICULTURE.**—Very funny indeed occasionally are the references to gardening or flowers which novelists sometimes make in their books, references that easily pass muster with the general public who know no better, and fail to escape criticism from those who do. But it was indeed a surprise to me to find so glaring an error in relation to even common wild flowers as I met with recently in *Kenelm Chillingly*, one of the late Lord Lytton's most interesting novels. There that distinguished writer refers to one of his minor heroines as toying and pulling to pieces a wild Daffodil, and plucking Blue Bells in a hayfield, and, of course, in the month of June. The novelist who intrudes into the domain of horticulture in any way will do well before he rushes into print to take counsel with a practical gardener. *D.*

**APPLE THE BALTIMORE.**—There is a coloured plate of an Apple named The Baltimore in the third volume of the *Transactions of the Horticultural Society*, where it is stated that the variety was raised in the garden of a Mr. Smith, of Baltimore; and the fruit from which the engraving was taken was imported from America, and exhibited by Sir Joseph Banks at the society's meeting held on December 2, 1817. It is described as weighing 1 lb. 7½ oz., and measuring 1 foot 2½ inches in cir-

conference, while its height was 4 inches; it is also said to have possessed very good flavour, although it was over-ripe. If the engraving is a true representation, the Apple was very handsome. It would be interesting to know if this variety was ever introduced into our nurseries or gardens, as it may be expected to have been after being brought prominently under the notice of Mr. Knight, of Downton, and other leading pomologists of the time. If so, what has become of it? *Thos. Coomber.*

**OIL-ROLLERS.**—I suggest that a modification on a small scale of the steam-roller, substituting oil for coal, would be very acceptable for garden use; not only for rolling gravel paths, but also lawns, croquet and tennis-grounds; a mowing-machine of suitable size being connected with it when required. *C. W. W., The Fryske, Jan. 2.*

**DENDROBIUM NOBILE.**—Two years ago I had the pleasure of sending you a photograph of *Dendrobium chrysanthum*, and a short description of the method by which I treated this section of Orchide. I now have pleasure in sending you a plate of *D. nobile*, which five years ago was a small imported piece of five or six pseudo-bulbs, and very weak. I think you will fully agree with me that my plan of leaving all the old pseudo-bulbs on the plant and not pruning, is perfectly satisfactory in regard to the flowering and general appearance of the plants. [The result is excellent in this case. Ed.] *Frank Lowe, The Gardens, Easthampstead Park, Wokingham.*

SOCIETY.

DEVON AND EXETER GARDENERS' ASSOCIATION.

JANUARY 3.—The annual supper of the members of the Devon and Exeter Gardeners' Association was held at the "Castle Hotel," on Friday evening.

The CHAIRMAN, in proposing the toast of "The Devon and Exeter Gardeners' Association," spoke of the valuable work which the Association had accomplished since its formation forty years ago. Men of great experience had read them about forty essays, which had been fruitful of useful discussions. The annual outings of the Association also had not only given the members pleasure, but also instruction. Ladies and gentlemen of the county had kindly thrown open their grounds, and in some cases their mansions. Members were enabled to inspect specimens of horticulture which they might not, perhaps, be able to see at home. A movement was now on foot to induce gardeners to make provision for their old age by joining the Gardeners' Royal Benevolent Institution.

The toast having been heartily drunk, Mr. HOPE, in response, said he had been identified with the Association from the commencement, and he was happy to say that it had been a success in every respect, socially, educationally, and horticulturally. They had, in fact, justified their existence. Very notable was the ability with which the young members prepared their papers. It showed that there were some excellent men growing up who would be quite capable of taking the places of the older men in the future. There were a good many similar institutions throughout the country, but the Devon Society was in the front rank.

Mr. POWELL proposed "The President (Mr. C. R. COLLINS), vice-Presidents and Committee," and after paying a high compliment to the way in which the Society was officered, remarked that if the Devon and Exeter Horticultural Society collapsed, and he hoped the day would be far distant, the Gardeners' Association would never allow the annual shows to drop.

Mr. Councilor HERBERT responded, and expressed a hope that during the next session of the Association one of the members would read a paper, on the best way to make the city's public parks, especially Northbenhay, more attractive. A little money spent in this direction would be profitable to the city.—*Extract from the Western Times, January 4, 1896.*

VARIORUM.

"ORCHARDS AND GARDENS, ANCIENT AND MODERN:" with a description of the Orchards, Gardens, Model Farms, and Factories owned by Mr. William Whiteley, of Westbourne Grove, London. By Alfred Barnard. (Printed by Sir Joseph Canston & Son, 9, Eastcheap, E.C.)—This book is chiefly remarkable as showing how, in spite of the prevalent feeling to the contrary, farming can still, if intelligently undertaken, be made to pay—and to pay well. The pages before us give the history of an enterprise which has only been started two or three years, but which, managed under the favourable auspices of "practical skill, business tact, and a

scientific education, with, of course, that necessary adjunct, capital," is already a thriving and flourishing concern. Mr. Whiteley has established his farms and factories at Hanworth, near Twickenham, and here fruit growing, farming, and preserving, with all the minor industries connected with them, are carried on, on a large scale. The whole book is one long lesson on the art of successful farming. It tells how crops are preserved as soon as ripe, instead of spoiling for want of immediate attention; how live stock are most profitable when carefully selected, bred, and reared; and how great is the gain effected by having manufactories on the spot and in the hands of the producer of the raw material, instead of situated at a distance and under different management; in fact, it is one long illustration of how much may be achieved by those who make the most of the opportunities open to them. The book is written in a light and chatty style; a few statistics and a little solid information being blended with a chatty account of Hanworth and its industries. There are many full-page illustrations showing the beauty of the neighbourhood, and giving a good idea of the scale on which Mr. Whiteley's enterprises are carried out, of the general principles upon which he works, and of the standard of his crops and of his cattle.

**DICTIONNAIRE PRATIQUE D'HORTICULTURE.**—The French translation of NICHOLSON'S dictionary, with additions and coloured plates, has now reached the article "Oncidium." For garden libraries and for those conversant with the French language, we commend this most useful book. It is published by OCTAVE DOIN, 8, Place de l'Odéon, Paris.

[The term "accumulated temperatura" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following—  
 0, Scotland, N. Principal Wheat-producing Districts—  
 1, Scotland, E.; 2, England, N.E.; 3, England, E.;  
 4, Midland Counties; 5, England, including London, S.  
*Principal Grazing, &c., Districts*—6, Scotland, N.  
 7, England, N.W.; 8, England, S.W. 9, Ireland, N.  
 10, Ireland, S. \* Channel Islands.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending January 4, is furnished from the Meteorological Office:—

The weather during this period was very dull and gloomy in all parts of the kingdom. Rain was of almost daily occurrence during the earlier part of the week, but later on the conditions became dry, with, however, a good deal of fog or mist.

The temperature was much above the mean, the excess ranging from 4° in 'Scotland, N. and E.' to 7° in 'England, F. and N.W.' and in 'Ireland, N.' and to 8° in the 'Midland Counties' and 'Ireland, S.' The highest of the maxima were recorded on rather irregular dates; they were very high for the time of year, ranging from 57° in the 'Midland Counties' and 'Ireland, S.' and 56° in 'England, S. and N.W.' to 51° in 'Scotland, N.' The lowest of the minima were registered on the first day of the period in most places, but on January 4 in the north and east of Scotland. They ranged from 26° in 'Scotland, E.' and 29° in 'Scotland, N.' to 36° in the 'Channel Islands,' and to 33° in the Irish districts.

The rainfall slightly exceeded the mean in 'England, N.E.' and just equalled the mean in 'England, E.' and 'Ireland, N.' but was less in all other districts.

The bright sunshine was very deficient, the percentage of the possible duration ranging from 7 in 'Scotland, N.' and the 'Channel Islands,' to 2 in 'Scotland, W.' and to 1 in 'England, N.E.'

Obituary.

CHARLES EASTWOOD—Many of our readers will learn with regret, of the death which occurred very suddenly at the age of 56, from apoplexy, on December 21, 1895, of CHAS. EASTWOOD, of Bloomergate Nursery, Mytholmroyd, and formerly of Lane House Nursery, Laddenden, and at one time well known in the trade as a successful grower of Gleichenias and various hardwooded plants.

MARKETS.

COVENT GARDEN, JANUARY 9.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal wholesalers, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table with columns for plant names and prices. Includes Adiantum, Aspidistra, Azalea, Chrysanthemums, Cyclamen, Ficus elastica, Foliage plants, Hyacinths, Lilium Harrisii, Marguerites, Mignonette, Palms, Parsley, Poinsettia, Primula sinensis, Tulips, Solanum, Ferns, and various other plants.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table with columns for fruit names and prices. Includes Apples (Blenheim, Nova Scotia, Wellington), Apricots, and various other fruits.

VEGETABLES.—AVERAGE WHOLESALE PRICES.

Table with columns for vegetable names and prices. Includes Beans, Cauliflowers, Mushrooms, Cucumbers, Onions, Potatoes, and various other vegetables.

POTATOS.

Trade still very quiet. With the continuance of mild weather, the tendency is much in favour of a further fall in the present low prices. Canary Island New Crop have made a small show on the market, and sales effect at from 18s. to 28s. per cwt. J. B. Thomas.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table with columns for flower names and prices. Includes Arums, Azalea, Bouvardias, Carnations, Chrysanthemums, Eucharis, Gardenias, Hyacinths, Lilium Harrisii, Lily of the Valley, Maidenhair Fern, Marguerites, Mignonette, Narcissus, and Orchids.

ORCHID-BLOOM in variety.

CORN.

Averages.—Official statement of the average prices of British Corn, imperial measure (qr.), for the week ending January 4, and for the corresponding period last year:—1895: Wheat, 25s. 2d.; Barley, 21s. 7d.; Oats, 15s. 10d. 1896: Wheat, 20s. 4d.; Barley, 21s. 5d.; Oats, 14s. 2d.

HAY.

Averages.—The following are the averages of the prices at the metropolitan markets during the past week:—Clover, prime, 80s. to 95s.; do. inferior, 60s. to 70s.; hay, best, 60s. to 95s.; do. inferior, 38s. to 60s.; mixture, 70s. to 85s. 6d., and straw, 20s. to 40s. per load.

ADDRESSES: Messrs. Pearson & Sons, Chilwell, Notts. Mr. B. Wynne, 1, Dane's Inn, London, W.C.

CORRECTION.—"Public Pleasure Grounds, St. Ives," p. 19, col. a, for Trengwainton, read Trewidion.

DOUBLE FLOWERED LAPAGEBIA BLOSSOM: H. C. T. A figure of a double flower of the white form of L. rosea appeared on p. 777, vol. xviii, 1882.

EUPHORBIA (POINSETTIA) PULCHERRIMA: A. Cor donnier, figs. There are two methods of propagation—by ripe shoots, and by green soft shoots taken off early in the spring, from plants slightly pruned after flowering and resting, and induced to grow by being placed in a warmth of 60°. These green cuttings should be taken off with a slight heel of older wood, stuck head downwards in a bowl or large flower-pot, and have dry sand dribbled amongst them till all are quite covered, except the butt ends, which should be left exposed. Here they must remain till no more juice exudes from the wound, and they should then be treated like ordinary cuttings, striking them in a bed of sand or in pots, over a bottom-heat of 80° to 82°. When rooted, pot them up into yellow loam one-third, peat one-third, leaf-mould one-third, with a little sand if the peat is not sandy or the loam is tenacious. Grow them in a warm-house till the end of May, shifting them as occasion may require, but depending for vigour largely on manure-water. The temperature may range at night towards 60° at the end of the month. After this date, place them in a pit that can be heated when required, and in which they can stand near the glass, not letting the leaves touch it. Keep moist by syringing the leaves and pots once or twice daily in sunny weather, and in high summer air may be pretty freely admitted. Do not use bottom-heat after the plants are established in pots, or they will grow up long-jointed and weak. When the days get cool, put them into a warmer (intermediate) house, or use artificial heat. Cuttings are usually made in this country from the mature shoots after they have lost their leaves, and the plants are at rest. No precautions have to be taken against bleeding, there being scarcely any sap to flow; and should it do so, it readily stops if the cuttings are put in a dry cool place. These may be struck a number together in pots of sandy soil, put on the shelf in the stove, and kept slightly moist. After-treatment is identical with what has been stated. If a Euphorbia is pinched at the point, a more branched plant is obtained; but the fracter, which are the decorative parts of it, being many, are small in size, so that "stop-jug" is not desirable when strong, large heads are looked for.

STRAFORD: Jan. 7.—There has been a fair supply throughout the week, but trade has been rather slow at the under-mentioned prices:—Collards, 1s. 6d. to 2s. 6d. per tally; Savoys, 2s. 6d. to 3s. 6d. per dozen; Cauliflowers, 1s. 6d. to 1s. 9d. per dozen; Scotch Kale, 6d. to 9d. per sieve; Beetroot, 6d. to 8d. per dozen; Horseradish, 1s. 1d. to 1s. 2d. per bundle; Parsley, 1s. 6d. to 2s. per doz. bunches; Brussels Sprouts, 1s. 3d. to 1s. 6d. per half-sieve; do. 2s. 6d. to 2s. 9d. per bushel; Turnips, 30s. to 40s. per ton; Carrots (household), 24s. to 30s. per ton; do. cattle feeding, 16s. to 20s. per ton; Mangels, 11s. to 15s. per ton; Swedes, 13s. to 18s. per ton; Onions, English, 80s. to 90s. per ton; do. Dutch, 55s. to 60s. per ton; do. Bordeaux, 5s. 6d. to 6s. 6d. per case; Apples, English cookers, 3s. to 4s. per barrel; do. American dessert, 12s. to 15s. per barrel; do. Nova Scotian, 11s. to 15s. do.

FARRINGTON: Jan. 9.—Quotations:—Savoys, 4s. per tally; Greens, bunch, 2s. per doz.; Cauliflowers, 1s. 6d. per bushel; Horseradish, 1s. 2d. per bundle (best); Rhubarb, 1s. 6d. per dozen bundles; Onions, 3s. 9d. to 4s. per bag; Celery, 14s. per dozen bunches; Apples, Greenings, 15s. per barrel; Newtown Pippins, 18s. do.; Baldwin's, 17s. do.; Golden Russets, 16s. do.; Mushrooms, 8d. per lb.; Grapes, English, 1s. 6d. per pound.

POTATOS.

BOROUGH: Jan. 7.—Quotations ranged from 40s. to 95s. per ton.

SPIRALFIELDS: Jan. 7.—Quotations: Sutton's Abundance, 60s. to 70s.; Bruces, 50s. to 70s.; Main Crop, 55s. to 70s.; Snowdrops, 60s. to 80s.; Imperators, 50s. to 65s.; Druids, 60s. to 70s.; Reading Giants, 45s. to 60s. per ton.

STRAFORD, January 7.—Quotations:—Bruces, dark soil, 31s. 6d. to 40s., do. light, 40s. to 60s.; Reading Giants, 40s. to 50s.; Sutton's Abundance, 50s. to 70s.; Scotch Main Crop, 80s. to 100s. per ton.

FARRINGTON: January 9.—Quotations:—Main Crop, 80s. to 85s.; Saxons, 70s. to 80s.; Sutton's Abundance, 40s.; Bruces, 55s. to 65s.; Magnums, 40s. to 50s.; Reading Giants (good), 55s. to 60s. per ton.

LONDON AVERAGES: January 9.—Saxons, 80s. to 100s.; Main Crop, 60s. to 70s.; Bruces, 50s. to 70s.; Puritans, 60s. to 70s.; Hebrews, 60s. to 70s.; Sutton's Abundance, 45s. to 50s.; Magnums, 35s. to 45s. per ton.

FRENCH BEANS GOING OFF: A G. The result which follows a too early or too abundant moulding up of the stems. It is better practice to finish the moulding in two operations, and thus allow the roots to extend upwards, and the stems to acquire firmness before the pot is filled with soil.

GAS ESCAPING INTO A WELL: R. F. If the escape of gas was great, and the well not frequently opened, the water might become inimical both to animal and plant life. It is a question of degree of contamination.

MICE, SQUIBBLES, AND BULBS: B. S. W. Try traps for the mice, and the gun for squirrels. Perhaps both might be kept from the bulbs by accustomed

them to other food, say Barcelona Filberts, waste grain, &c. They eat the bulbs for lack of more suitable food.

NAMES OF FRUITS: *A. D.* 1, Betty Geeson?; 2, Scarlet Nonpareil; 3, Cox's Pomona.—*J. J.* Apple Carraway Russet.—*A Constant Reader.* Apple, Rosemary Russet.—*W. T. Holmes.* Pear, Uvedale's St. Germain.

NAMES OF PLANTS: *Constant Reader.* *Odontoglossum Rossi* var. *pallens*.—*F. A. L.* *Vanda Americana*.—*W. M. M., Ross.* 1, *Cypripedium insigne* Chautini; 2, *C. insigne* with broader petals than usual; 3, *Odontoglossum nebulosum*; 4, *Oncidium tigrinum*.—*A. W.* *Epidendrum ciliare*.—*Qms.* 1, *Cymbidium giganteum* or *C. Lowianum*; seed flower; 2, *Brassia verrucosa*; 3, *Oncidium sphaecelatum*; 4, *Zygopetalum Mackayii*.

ONCIDIUM: *H. Bailey.* Many thanks for inflorescence of *Oncidium chrysomorphum*; it is a very singular species.

PLUMS AND PEACHES: *A. M.* The distance between standard trees may range from 15 feet for most varieties of Peaches, and the weaker-growing Plums, to 17 feet for strong growers. At 15 feet apart, the number required per acre is 193; and at 17 feet, 150.

TEOMA SMITHI: *A. Cordonnier.* The treatment accorded to a *Casmelia* or to *Polygala Dalmanea* would suit this plant. Whilst small, it may be advisable, in some localities, to keep it in a cold frame facing south, from May to September. In most parts of your country it would make fine progress if it were planted out for the summer, or its pot sunk in the soil, or a bed of sand or gravel. In hot weather, daily syringing would be very necessary. We believe seed can be obtained at some seed-houses in this country. It must be as easy to grow as *Bignonia radicans*.

VILLE'S COMPOUND AND GRAPE VINES: *W. A. M.* If we take 5 oz of this compound as being a sufficiently powerful dressing for the soil to a depth of 6 inches, 30 oz, or nearly 2 lb, would be required for 1 cubic yard. If the border is made up all at one time, nearly all of this manure would be lost before many of the Vine-roots reached the parts where it was placed.

CONTINUED INCREASE in the CIRCULATION OF THE "GARDENERS' CHRONICLE."

IMPORTANT TO ADVERTISERS.—*The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper, increased to the extent of more than 80 per cent., and that it continues to increase weekly.*

Advertiser are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

Complete Apparatus from £4 8s. Lists and Estimates on application. MESSENGER & CO., Loughborough, Leicestershire. London Office: 163, Palmerston Buildings, Old Broad St., E.C.

ROBERT WARNER & CO'S NEW PATENT WINDMILLS.

Saves Coal. Pumps Water, Grinds Corn, Cuts Chaff, &c. Supports can be made in Teak, Iron, or Steel, for Hot Climates. Prices from £17, including Pump and Timber Supports. May 27, 1893, The Dell, Englefield Green, Surrey. ROBERT WARNER & Co., Engineers, 27, Jewin Crescent, E.C. Dear Sirs,—It affords me much pleasure to inform you the 25 ft. Annular Sail geared Windmill, on 40 feet timbers, working a set of 3 in. x 8 in. stroke treble pumps, that you fixed here for Baron Schröder, is giving very great satisfaction, pumping the water through 4,224 feet of pipe, to a vertical height of about 80 feet. I must also express my thorough appreciation of the manner in which the whole of the work has been so successfully carried out.—Yours faithfully, H. BALLANTINE, Head Gardener to Baron Schröder. R. WARNER & Co. have made and erected a similar Mill and set of Pumps for Lord Northbourne. NUMEROUS OTHER TESTIMONIALS ON APPLICATION TO 27, JEWIN CRESCENT, CRIPPLEGATE, LONDON, E.C. ## County of Essex.

## TECHNICAL INSTRUCTION COMMITTEE.

**INSTRUCTION IN HORTICULTURE.**—A Short Course of Elementary Instruction in the Science and Practice of Horticulture will be given during the three weeks commencing February 3, 1896. The Classes will be held daily at the Technical Laboratories, Chelmsford. The Committee are prepared to receive applications for admission from youths over fourteen years of age, resident in the county, and either employed in gardens or seeking such employment. From these the Committee will select candidates for Fifteen Scholarships, holders of which will be eligible to receive a maintenance allowance during their course of instruction, and will be allowed a return railway fare to Chelmsford.

For further particulars and forms of application (which must be returned before January 25, 1896) apply to—

J. H. NICHOLAS, Secretary.

County Offices, Chelmsford.

**TO FLORISTS.**—Young Lady requires re-engagement. First-class experience and references. Miss YATES, Messrs. Clibran & Son, 12, Market Street, Manchester.

**UNITY IS STRENGTH, may indeed be said** with regard to HOLLOWAY'S PILLS and OINTMENT, for when used together, they are remarkable in their effects upon disease. No matter how stubborn the symptoms may be, they cannot long withstand these remedies. All sufferers, whom other treatment has failed to relieve, should try the celebrated Ointment, which will strengthen and cure them. The Pills recommend themselves to the attention of all sufferers. No injurious consequences can result from their use; no mistake can be made in their administration. In indigestion, confirmed dyspepsia, and chronic constipation, the most beneficial effects have been, and always must be, obtained from the wholesome power exerted by these purifying Pills over the digestion.

## NOTICE TO ADVERTISERS.

In consequence of the alteration of the hour of going to Press, consequent on the large increase in the circulation, it is imperative that all Copy for Advertisements should be received BY FIRST POST THURSDAY MORNING at the latest.

### Seeds—Their Cost and Quality.

IT IS A FACT all can save 3d. to 4d. in a 1s. by having their seeds (of far superior quality and heavier crops) direct from us, the actual growers, on the best spot in the world for producing them, thus getting that which is so lavishly expended to force a sale for the ordinary bought here, there, and everywhere—inferior foreign productions. The secret is to be supplied direct from the actual producers (300 acres). Most practical Catalogue free to coming customers.—H. CANNELL AND SONS, Swanley, Kent.

NOW is the TIME to PLANT PEONIES and DELPHINIUMS.

Catalogue of KELWAY AND SON, Langport, Somerset.

HENRY RIDES, SALESMAN, Central Avenue, Covent Garden, W.C. Highest Market Prices. Prompt cash.

SUPERB ORCHIDS, CHEAP.—Thousands to select from. Write for LIST, free. P. McARTHUR, The London Nursery, 4, Maiden Lane, London, W.

SEED POTATOS.—For Sale, Myatt's Prolific (True). 80s. per ton. G. F. YOUNG, Swineshead Abbey, Near Boston.

TECOMA SMITHII.—The finest new flowering plant; as easily managed as a Chrysanthemum. It produces in Autumn large heads of brilliant red and yellow blossoms. New seed of all Seedsmen.

## SUTTONS' PRIMULAS. THE BEST.

SUTTONS' PRIMULAS.—Single and Double, separate varieties at 2s. 6d. and 5s. per packet; Mixed, Single, at 3s. 6d. per packet; Mixed, Double, at 2s. 6d. and 5s. per packet. Post-free.

SUTTONS' PRIMULAS.—W. T. Lamb, Esq., of Down Court, says:—"The Primulas from your seed are considered by all my neighbours to be the finest they have seen."

SALES BY AUCTION.

WEDNESDAY NEXT.

IMPORTANT SALE.

A Choice Selection of Standard, Pyramid, and Dwarf-trained FRUIT TREES, including many of the leading sorts.

1000 Standard, Half-Standard, Dwarf, and Climbing ROSES, of named sorts, including many of the best, from an English nurseryman.

A Collection of Flowering Shrubs and Trees, CURRANT and GOOSEBERRY TREES, SPIRÆA JAPONICA, in quantity, ARUMS, &c.

An Extensive Collection of Carnations, Iris, Home-grown LILIUMS, LILY OF THE VALLEY CROWNS, LILUM AURATUM from Japan, BEGONIAS, Pearl and South African TUBEROSES.

MR. J. C. STEVENS will SELL the above by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, on WEDNESDAY NEXT, January 22, at half-past 12 o'clock precisely.

On view morning of Sale, and Catalogues had.

Thursday Next, January 18.

VALUABLE IMPORTED and ESTABLISHED ORCHIDS.

By order of Messrs. W. L. Lewis & Co.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY NEXT, January 23, at half-past 12 o'clock precisely.

IMPORTED ORCHIDS,

Comprising Odontoglossum, Oncidium, Cattleya, Epidendrum, Sophronites, &c. Also Well-grown ESTABLISHED ORCHIDS, including Odontoglossum Pescatorei and G. cirrhosum, with flower-spikes; also five plants of *Lælia autumnalis* alba, *Lælia anceps*, *L. Arnoldiana*, *Oncidium concolor*, *Promaea citrina*.

On view morning of Sale, and Catalogues had.

Friday Next, January 24.

By order of Mr. P. McArthur, The London Nurseries.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at their Central Sale Rooms, 87 and 88, Cheapside, London, E.C., on FRIDAY NEXT, January 24, at half-past 12 o'clock, a valuable importation of ORCHIDS, including some magnificent plants of

**CATTLEYA ELDOORADO SPLENDENS** and **WALLISII**. The collector describes them as follows: The coloured forms are larger, and of a more rosy tint, with the lip dark lilac, and the discs golden, edged with white. Numerous white varieties are among them. They are in perfect health, with fresh green leaves, and were found at an altitude of 1900 feet. They are very free flowering, and probably the finest type ever introduced into Europe. Also

**CATTLEYA MOSSIE**, THE TRUE CHIRGUENSIS, This is very scarce and of great value; the flowers are round and very handsome, of a bright rosy colour, and richly denticulated, with the labellum of a rich magenta colour, bordered with pale yellow. It is very free-flowering and a good grower. Found on cool, high mountains. Also

**CATTLEYA MOSSIE, VAR. MARIÆNSE**. A sweet-scented and very distinct variety, flowering in April and May, and of which the collector has sent all that he found. The flowers are very beautiful, with violet petals, light blue sepals, and a large labellum of velvet magenta, with rich purple border and white margin. Also,

**CATTLEYA LABIATA, NEW**. From the description sent, most probably a hybrid between *C. labiata* and *C. Mossie*, from which many very beautiful varieties may be expected. Also some remarkable specimens of the new **ONCIDIUM PAPILLO MAJUS**, and some selected strong plants of **CYNOCHES CBLOROCHILUM**, **ANGULOA RUCKERII**, &c.

In consequence of the revolution in Venezuela, the difficulties in procuring these plants have been enormous. The collector has had to hide in the forests during the day-time, and travel at night.

On view morning of Sale, and Catalogues had.

HEMEROCALLIS AURANTIACA MAJOR,

A Magnificent New Species,

ONE OF THE FINEST INTRODUCTIONS OF RECENT YEARS.

Large importation of 900 Clumps, just received from Japan. By order of Messrs. Bunting & Sons, the entire shipment being offered.

The Plant is described and figured in the *Gardeners' Chronicle*, July 20, 1895, where, on p. 62 Professor BAKER states that it is the finest *HEMEROCALLIS* he has seen. It has also been figured in the *Gardeners' Magazine* and *Journal of Horticulture* for August 17 and August 15, 1895, respectively, and is most highly spoken of in every report. It received F.-O. Certificates, Royal Hort. Soc., July 9, 1895, and also at the Manchester Royal Botanical Society, August 24, 1895.

A Coloured Plate will be on view at the time of Sale. Messrs. Bunting & Son were the first to introduce this valuable plant, receiving a few from Japan two years since, and the figure in the *Gardeners' Chronicle* was taken from a plant bloomed at their nurseries.

It is quite hardy and very vigorous, foliage deep green, flower spikes strong, bearing as many as twelve flowers in succession, 7 to 10 inches across, of a rich orange-yellow, quite distinct. The flowering period lasts from July to the end of August. It is in every way a most valuable acquisition.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION at their Central Sale Rooms, 87 and 88, Cheapside, London, E.C., on WEDNESDAY, February 5, at Twelve o'clock.

On view morning of Sale, and Catalogues had.

SALES NEXT WEEK.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at their Central Sale Rooms, 87 and 88, Cheapside, London, E.C., as follows:—

MONDAY, JANUARY 20.—75 *A. indica*, in bud; 50 *Camellias*, 36 *Palms*, and 100 *Lilium lanifolium* album, from the Continent; 300 dwarf *Roses*, Stove and Greenhouse Plants, hardy border Plants, Bulbs, &c.

TUESDAY, JANUARY 21.—High-class Perennials, many never offered before, thousands of *Carnations*, *Picoetes*, *Cypripediums*, *Iris*, &c., importations from the Western States, Caucasus, California, &c.

WEDNESDAY, JANUARY 22.—Imported Japanese *Lilies* in great variety, *Fruit Trees*, 50 lots of *Stove* and *Greenhouse Ferns*, 300 dwarf *Roses*, *Cannas*, *Gladioli*, *Iris*, *Asters*, *Dahlia*, *Anemones*, *doubla* and single *Begonias*, *home-grown Lilies*, *Pæonies*, double and single *Pyrethrum*, *Hollyhocks*, and *Carnations*, to vary.

THURSDAY, JANUARY 23.—125 double *Begonias*, to name; 100 red Moss *Boses*, 200 dwarf *Roses*, 310 *Azalea indica* and *nobilis*, 60 *Camellias*, 50 *Rhododendrons*, from the Continent; hardy perennials, *Carnations*, *Gladioli*, &c.,

FRIDAY, JANUARY 24.—Special Sale of hardy Perennials, *Tuberuses*, *Begonias*, *Dahlia*s, *Hollyhocks*, *New Carnations*, *Pæonies*, *Pyrethrum*, and *Ivies*, at 12 o'clock. On view mornings of Sale, and Catalogues had.

Friday Next.

By order of Messrs. W. L. Lewis & Co.

IMPORTED ORCHIDS.

In magnificent order, comprising—**ODONTOGLOSSUM ROSSII MAJUS**.—A wonderful lot, with large bulbs, in selected varieties.

**CATTLEYA CITRINA MAGNIFICA**.—A superior form, from a fresh locality; flowers with broader segments, and much more expanded.

**EPIDENDRUM VITELLINUM MAJUS**, with huge bulbs. A finer lot of plants have never before been offered by auction.

**CATTLEYA HARRISONÆ VIOLACEA**, including some well-leaved masses; together with **SOEPHONITIS GRANDIFLORA**, **ONCIDIUM MARSHALLIANUM**, and **G. CRISPUM GRANDIFLORUM**.

Also, 18 **CELOGYNES** of sorts, and IMPORTED ORCHIDS, from Messrs. F. Hoggan & Co.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION, at their Central Sale Rooms, 87 and 88, Cheapside, London, E.C., on FRIDAY NEXT, January 24, 1896, at half-past 12 o'clock.

On view morning of Sale, and Catalogues had.

County of Salop.—Oswestry and Whittington. VALUABLE FREEHOLD MESSUAGE, SHOP, AND NURSERY GARDEN.

To be offered for SALE by PUBLIC AUCTION, by MESSRS. WHITEFIELD AND SON, at the Queen's Hotel, Oswestry, on FRIDAY, JANUARY 24, 1896, at 4 P.M., punctually, subject to conditions to be then produced.

Lot 1.—All that FREEHOLD MESSUAGE, DWELLING-HOUSE, and SHOP, with the appurtenances thereunto belonging, situate, and being No. 6, The Cross, Oswestry.

Lot 2.—All that very desirable freehold NURSERY GARDEN and Gardener's COTTAGE, known by the name of "Rose Hill" Nursery, situate at Whittington, in the county of Salop, containing by admeasurement 4 acres or thereabouts.

The Nursery contains 14 Conservatories, Vineries, Peach-houses, &c., containing a total area of 11,000 square feet of glass; also Cool Frames, set in brick, containing an area of 1,200 square feet of glass. The Nursery comprises Gardens, Cottages, with Kitchen, Out-offices, and two Bedrooms. Also Potting Sheds, Stabling, Cart-house, with Store-room, and Propagating-house.

The premises afford every railway facility, being situate adjoining the Great Western Railway Station at Whittington, and within two minutes' walk of the Cambrian Railway Station, and are within 2 miles of the excellent market town of Oswestry. The whole of the above premises have been carried on as a Nursery for a period of over thirty years by Mr. Robert Porter.

The Nursery Stock, &c., and Shop Fixtures, may be taken to by the Purchaser, at the Auctioneer's valuation.

For Particulars and Plan, apply to the Auctioneers, Willow Street, Oswestry; and to Messrs. MARSHALL & HASLIP, Solicitors, 24, Martins Lane, Cannon Street, London; and to Messrs. MINSHALLS & PARRY-JONES, Solicitors, Oswestry.

ORCHIDS! ORCHIDS!

JOHN COWAN AND CO. are offering this week a large and splendid lot of ORCHIDS in flower and showing for flower; all are in the finest condition, and such as the Company can with confidence recommend.

# SUTTON'S NEW EARLY PEAS.

## THE SUTTON FORCING.

In this new and distinct wrinkled variety, we offer the forcing Pea *par excellence*. Per packet, 2s. 6d.  
 "An excellent early variety, especially adapted for forcing or early work in frames. The Peas have the true marrowfat flavour."—Mr. O. H. COPE, *The Gardens, Holnest Park.*

## SUTTON'S EXCELSIOR.

A new dwarf early Marrowfat, the haulm attaining to about 15 inches in height, and heavily cropped with massive pods. Per packet, 2s. 6d.  
 "A robust dwarf early Pea, of excellent quality, and a profuse cropper. In every way a most desirable variety."—Mr. C. LLOYD, *The Gardens, Coversham Park.*

## SUTTON'S EARLY GIANT.

The largest-podded Pea yet raised. Will prove a formidable competitor on the exhibition stage. Pods covered with a dense bloom and filled with dark-green peas. Per packet, 2s. 6d.

**SUTTON'S SEEDS**  
 GENUINE ONLY FROM SUTTON & SONS, READING.

# VEITCH'S GENUINE SEEDS

## CAULIFLOWER, Veitch's Extra Early Forcing.

*First-class Certificate, Royal Horticultural Society.*  
 Of dwarf, compact habit, with short stems and small leaves. Highly recommended for forcing or very early use. Per packet, 1s. 6d. and 2s. 6d.

A Gardener writing to the "Journal of Horticulture," last week, says:—  
 "For many years the variety of Cauliflower I depended on for an early supply was Dwarf Erfurt, but this has been superseded by VEITCH'S EARLY FORCING. I have cut heads of this off a west border in the end of May, and have continued cutting from the same sowing all through June. This variety has the invaluable property of producing, in addition to a central head, three to four others that are ready to cut a week to a fortnight after the former. I am acquainted with no other that possesses the like habit of second heading, and in this respect alone, if for no other, the variety is worth attention."

*Illustrated & Descriptive Catalogue post-free on application*

 ROYAL EXOTIC NURSERY, CHELSEA, S.W.

# THE Gardeners' Chronicle.

SATURDAY, JANUARY 18, 1896.

EATON HALL.

[SEE SUPPLEMENTARY ILLUSTRATION.]

THIS princely estate, with its magnificent mansion and beautiful gardens and pleasure-ground, is known throughout the world, it being visited yearly by people from almost every habitable part of the globe. The gardens have been greatly improved in all departments of late years, and at the present time there is to be seen in the various houses a large display of flowering plants artistically arranged. The Orchids just now are well worth a visit; the various Orchids in flower are arranged in a span-roofed house built of teak, which is 80 feet long, about 18 feet wide, with a walk running down the centre. The side stages are covered with plants of Orchids in flower set on a groundwork of various Adiantums, to which there is an edging of *Panicum variegatum*; and from the roof hang baskets filled with the beautiful *Asparagus reflexus*—the whole having a very charming appearance. The dull brown teak-wood rafters and transoms contrast, and show off the colour of the flowers in a telling manner. Here are many hundreds of flowering spikes of *Calanthes*, viz., *Veitchii*, *oculata* var. *lutea*, *oculata* var. *rubra*, the gracefully arching flower-spikes intermingling with those of *Odontoglossum*, *Cypripediums*, *Angraecum sesquipedale*, the bright *Sophronis grandiflora*, *Masdevallia tovarensis*, *Lælia anceps*, and the favourite species, *Vanda cœrulea*. The above names do not include a tithe of the display, there being many varieties of each species, and all are in perfection at the present time. A display will be kept up for some time yet, for there are several well-grown *Lælias*, *Cattleyas*, *Odontoglossums*, *Dendrobiums*, &c., in the various houses, which show numerous flower-spikes that will shortly succeed the others. Other glass-houses contain displays of various winter flowers, one house being made gay with *Freeseas*, *Tulips* in variety, *Lily of the Valley*, *Roman Hyacinths*, a magnificent strain of *Cyclamen persicum grandiflorum*, *Sutton's Butterfly* being one that is particularly fine; these are in bloom in dozens, beautifully arranged.

Another span-roofed house forms a contrast with the last-named, the plants employed being *Roman Hyacinth*, *Narcissus*, *Azalea Deutsche Perle*, *Rhododendron præcox*, yellow and white-flowered *Chrysanthemums* in 4½-inch pots, and quite dwarf in stature; *Freesia refracta*, *Daphne indica* in variety, *Colosias*, very fine for so late in the season; *Boronia megastigma*, dwarf varieties of *Canna*, very fine for this season; and very conspicuous, a beautiful hybrid, warm-house *Rhododendron*, *Duchess of Westminster*, which

# Williams

STERLING  
 NOVELTIES for 1896.  
 Our own introduction—now offered for the first time.  
 Post Free.

## BEAN, DWARF FRENCH, WILLIAMS' EARLIEST OF ALL.

This new variety is the earliest French Bean in cultivation. It can be forced a good deal earlier than any other variety. It is a splendid variety for pot culture as well as for outdoor work. It grows from 18 to 21 inches high, is a strong vigorous grower with a good constitution; the pods are long, broad, and fleshy, and of a green colour. They are very tender when cooked, and of excellent flavour. Per packet, 1s. 6d.

## TOMATO, "WARRIOR"

This magnificent variety is a very free setter and good cropper, producing its fruits in great clusters. The fruit is large, round, and without ribs. The flesh is of a crimson colour, firm, with flavour of the finest quality. As the fruit is exceedingly symmetrical in shape, it will prove very valuable as an exhibition variety. Per packet, 1s. 6d.

## NEW GIANT PRIMULA—PRIMULA SINENSIS FIMBRIATA "Magnum Bonum."

This beautiful variety will form an excellent companion to the Giant White Primula, "Snowball," we sent out last year. We have every confidence in placing it before our Customers. The plants are very sturdy and compact in habit; the flower stem is strong, and rises well above the strong, robust foliage. The blooms are produced in great profusion, of a gigantic size, beautifully fringed, and the colour is a very beautiful shade of a rich deep red. Per packet, 5s.

For full descriptions of above see  
 ILLUSTRATED SEED CATALOGUE for 1896,  
 which will be forwarded, gratis and post-free,  
 to all applicants.

*Webbs' Spring Catalogue, post-free, 1s.*

**WEBBS', WORDSLEY, STOURBRIDGE.**

looks as if it were a cross between *R. Princess Royal* and *R. jasminæformis*. It is a free-flowering plant, the flowers of a soft rose colour. These various subjects are capitably arranged with various fragrant species of *Pelargonium*; the combination of odours and the blending of the colours of the various plants are exceedingly grateful to the senses. The house of aquatic plants has a water-tank in the middle, and staging at the sides, on which flowering plants in variety are arranged in batches of twelve or more of one kind that are intermingled with foliage plants. There were remarked here plants of *Euphorbia* (*Poinsettia*), *Justicia speciosa*, *Centropogon Lucyanus*, *Reinwardtia* (*Linum*) *trigynum*, *Gesneria* in variety, *Begonias Gloire de Soeaux* and *Gloire de Lorraine*. The long corridor is at present gay with plants of *Chrysanthemums* in leading varieties, well grown, properly flowered, and arranged with good taste. Two very useful plants should be named which are trained over the roof of this corridor, and which form a conspicuous feature at this season, viz., *Acacia dealbata* and *Cassia oorymbosa*. These plants are of very large dimensions, and they are covered with flowers in profusion, the distinct brightness of the two shades of yellow coming out very effectively. There are besides houses filled with *Tree Marguerite*, and *Souvenir de la Malmaison Carnations*, fine seedling forms being prominent among the first-named, which are in flower. The last-named is cultivated in thousands, the plants being as good as one could desire. They range in size from cuttings to large specimens, consisting of thirty growths and more, clean, robust, and healthy, and furnished with luxuriant foliage down to the soil, and without a trace of disease. Quite an acre of *Carnation* is grown outside, consisting of the leading varieties. I noticed in the house enormous quantities of *Richardias*, *Lilium longiflorum* *Harrisii*, *Salvias* in variety, *Justicia flava*, *Plumbago rosea* var. *coccinea*, *Bouvardias*, *Pelargoniums*, *Gardenia grandiflora*, &c., and *Ixoras* which are grown by the thousand to meet the enormous demand for out blooms for decorative uses. The number of plants, of *Lilac*, *Azalea mollis*, *Staphylea*, *Gueldres Roses*, and other shrubs suitable for forcing is very great. The *Hyacinth*, *Tulip*, *Narcissus*, *Lily of the Valley* are forced in great numbers.

#### FRUIT HOUSES, &c.

These, as may be imagined, are very extensive, the demand for fruit being a very large one, and it was easy to note that everything connected with fruit culture seemed to be in proper order, with cleanliness and good management visible on every side. The ordinary department of the gardens is amply furnished with everything required by the enormous consumption of the place, and necessarily it is well attended to. The very extensive grounds are in the best of keeping, and the various flower gardens received much attention at Mr. Barnes' hands, everything being well done, both as regards the summer and spring bedding.

The owner does not raise all these enormous quantities of flowers, fruits, &c., for his sole pleasure, but large quantities of flowers are given away to various charitable institutions; one recent act of generosity we read in the *Daily Telegraph* of December 26, was to give to St. George's Hospital, London, hot-house flowers to profusely decorate the various wards, many of which came from Eaton Hall. His Grace was also the donor of wine and game, an example that might be followed by many other gentlemen of large means.

Great praise is due to Mr. N. F. Barnes, the head gardener at Eaton Hall, for the many improvements he has made in the gardens. A. Outram.

#### THE "CEDAR" OF CENTRAL AFRICA.

In Commissioner Johnston's report of the first three years' administration of the eastern portion of British Central Africa, there is a sketch-map showing the agricultural condition of this country and the extent of such forests as yet remain. Mr. Johnston says:—The dense forests are now mainly confined to certain hilly regions, where local circumstances protect them to some extent from destruction by bush-fires. They are always associated also with either an unusual rain-supply, or with the presence of underground springs. Slightly stagnant or surface water appears to contain too many salts in solution to be favourable to the growth of forest, and such forests as are usually found growing near swampy districts are Palm thickets. There is one magnificent forest of *Raphia Palms*—one of the grandest sights I have ever seen in the vegetable world—near Jumbo's town, Kota-Kota, in the valley of a sluggish stream flowing into the Bua. As a remarkable feature peculiar to British Central Africa should be noted the splendid "Cedar" forests on the upper plateau of Mlanje. Until the explorations of Mr. Alexander Whyte, the naturalist attached to my administration, it was not known that any Conifer existed in Central Africa south of Abyssinia, and north of the Drakensberg, with the exception of a few small Juniper bushes discovered by Mr. Thompson growing on Mount Kenia and one or two other heights in Equatorial Africa. The existence of Conifers on the top of Mlanje was first reported by the Rev. Robert Clelland, a missionary belonging to the Church of Scotland Mission. Not much heed was given, however, to this news, because no specimens were sent home for identification. But, undoubtedly, Mr. Clelland's information put us on the scent, and one of the first things I attempted on arriving here in 1891 was to have the upper plateau of Mlanje explored. As a consequence, Mr. Whyte discovered the grand Conifer of the genus *Widdringtonia*, to which his name was given. An account of this tree, and the circumstances of finding it, were given in an earlier report of mine printed by the Foreign Office. This *Widdringtonia* would appear to be nearest allied to the *Cypresses*, as it unquestionably is by the shape of its seed-vessels, and the nature of its foliage; at the same time, it is widely different from the *Cypresses* in shape and size, and far more resembles the Cedar, both in appearance and in the fragrant smell of its timber. It would seem now as though there were two different species of *Widdringtonia* growing on Mlanje, one a very lofty tree, reaching fully to 130 feet in height, and the other scarcely exceeding 30 or 40 feet, and growing in a very straggling habit. There is a slight difference in the foliage of the two species. We have not yet been able to get the dwarf species identified, but hope to do so before long. In regard to this *Widdringtonia*, I might mention that Mr. Whyte has spared no efforts to introduce, or, let us say, re-introduce, its growth into all parts of the Shire highlands above 3000 feet in altitude. The tree would appear to flourish at a relatively low altitude, inasmuch as those planted in the grounds at Zomba, below the Residency, at an altitude not exceeding 2900 feet above the sea, leave nothing to be desired as regards their vigour of growth, some of the young seedlings having attained a height of 5 feet in two years. Mr. Sharpe believes that he has seen a *Widdringtonia* growing on one or two of the more inaccessible peaks of Zomba, and judging from what I could see through a field-glass, I think he is right in his opinion. Nowhere else, however, throughout British Central Africa, or in the adjoining regions, has anyone reported the existence of this Conifer. Baron von Eltz has made an active search over the lofty Livingstonia Mountains, at the north end of the lake, but has failed to find anything of the kind.

As an example of the rapid application to practical usefulness to which we have put this discovery of Mr. Whyte's, I may mention that, whereas the definite existence of the tree was only first made known in October of 1891, in June, 1893, Captain Johnson, commanding the Indian troops at Mlanje, was having the dead trees sawn up into logs, which were being sold to advantage in Blantyre; and, later on, in the autumn of 1893, enough Cedar-wood was supplied from Mlanje to re-roof the whole of the Residency and its attendant buildings at Zomba, besides which a great many useful articles of furniture have been made of the wood. *Timber Trades' Journal*.

#### MR. CHAMBERLAIN'S GARDEN.

THE collection of Orchids at Highbury has been the subject of many a note in the *Gardeners' Chronicle*, and is famed for its representative and choice character. It happens, though, that Orchids, whilst exceptionally showy in most instances when in flower, are not to be seen in bloom in large quantity at all seasons of the year. When the writer then, on a day last autumn, visited Mr. Chamberlain's garden for the first time, and had the pleasure to inspect the collection in company of Mr. Barberry, very few species were to be seen in the only stage when an Orchid is interesting to the ordinary individual. A gardener, however, is not insensible to the pleasure and profit to be derived from an examination of a collection of any species of plants, though flowerless at the time, providing it exhibits careful and successful culture, and to this fact it was due that my visit to Highbury was not—so far as the Orchids were concerned—devoid of instruction.

One of the chief delights I experienced, however, was that obtained from the corridor, into which most of the houses open, and which serves to connect them with a charming fernery, thence a conservatory, and finally with Mr. Chamberlain's drawing-room. This corridor is of considerable length, but very moderate in width, and it was pretty and remarkable, because more care had been taken to furnish it with climbers, and to tend them, than is exercised in the case of similar structures in many instances that occur to my mind. Speaking from memory, I cannot recall all the suitable plants that were included, but amongst them I well remember the *Fuchsias* in several varieties, *Daturas* (*Brugmansia*), single and double white; *Pasiflora* (*Tacsonia*) *Vau-Volxemii*, *Plumbago capensis*, and *P. c. alba*; whilst several of the various and beautifully-coloured *Ipomoeas* were among the most effective of all. Then there were *Cestrum* (*Habrothamnus*), *Lapagerias*, *White Jasmines*, *rosea*, &c.; and *Abutilons*. The temperature of the structure is evidently an intermediate one, in summer becoming very warm, or such a place there is, of course, most abundant material, and of very choice description, wherewith to make it beautiful, and to many minds more charming and interesting than many a conservatory. There are the *Dipladenias*, *Gloriosas*, *Bignonias*, *Allamandas*, *Aristolochias*, *Schubertia grandiflora*, *Thunbergia Harrisii*, *Combretum purpureum*, *Cissus discolor*, *Clerodendrons*, *Bougainvilleas*, *Pergularia odoratissima*, *Stigmaphyllon ciliatum*, with yellow flowers, closely resembling at a distance those of an *Oncidium*, and *Tecomae*. If there is not sufficient heat for some of the foregoing, there still remains the cooler species, such as *Cissanthus Dampieri*, *Clematis indivisa lobata*, many of the *Bignonias*, *Cobbeas* *Kennedya Trachelospermum* (*Rhynchospermum*) *jasminoides*, *Swainsonias*, *Hibbertia Cuninghamsii*, *Fagelia bitanica*, *Mandevilla suaveolens*, *Thibaudia acuminata*, *Acacia Kiceana*, *Sollya heterophylla*, and others.

Mistakes in the culture of climbers are most commonly the following. Too close planting, insufficient attention to watering and feeding the roots and to thinning the growths adequately and at the proper time. Then in some cases is the additional one of allowing them to become infested with fly, thrip, or other injurious pest. In the matter of selection, only the most beautiful, and those best suited to the

structure, should be planted, thick planting avoided, or it will afterwards be impossible to keep each to itself. Never allow the growths to become crowded, but thin them out as required, always cutting away the weakest, and leaving the others either their whole length (as is necessary in most cases), or sufficiently long to hang gracefully from their support. Attend constantly to the watering of the borders, that these are not allowed to sodden, neither become too dry, and afford a little fertilising manure as often as the case may require it. Above all, keep the plants scrupulously clean, and any gardener who has a structure suitable for the culture of climbing or pillar plants, by planting now, and treating them afterwards with care, will be pleased with the result.

Another striking feature of Mr. Chamberlain's garden is this: never have I noticed a place where more has been made of the land available than at High-

ARISTOLOCHIA GIGAS STURTEVANTH AT WASHINGTON.

Our readers are indebted to Mr. A. Dimmick, of Messrs. F. Sander & Co.'s, St. Albans, for affording them the opportunity of seeing how well this showy creeper does in the warmer parts of the United States. He saw the plant illustrated (fig. 10) growing last summer on a fence surrounding the President's garden at Washington, D.C. It produced more than a hundred well-expanded flowers, and created quite a sensation among the numerous visitors to the gardens. Our readers will not wonder at this when they recall the gigantic size and quaint form of the flower, and its singular colouring and markings. An excellent figure of the species in question was given in these pages on November 7, 1891, taken from a flower shown at a meeting of the Royal Horticultural Society by the Director of the

flowers; a green-leaved *Tradescantia zebrina*, growing along the borders made an effective contrast.

*Clematis integrifolia lobata* forms a fine feature here in the early spring, but at the time of my visit it had been taken outside through one of the ventilators and allowed to make its growth there. It is taken inside before the approach of winter, and under this treatment, most satisfactory results are obtained.

Directing our steps to other glass structures, we first enter the orchard-house, some 220 feet in length, filled with Apple and Plum trees, whilst Peaches and Nectarines in the best varieties grow on the wall at the back of this structure, and carry good crops. The Waterloo Peach is the best early Peach here; it has a higher colour and better flavour than Alexander, and has a stronger constitution. Amongst Nectarines, Pine-apple, Lord Napier, and Victoria carried good crops last year. Pine-apple is found to be a little earlier than Victoria.

FIG. 10.—ARISTOLOCHIA GIGAS STURTEVANTH: GREATLY REDUCED.

bury, where, in a space of about 110 acres, there has been made a very fair garden, with numerous plant and fruit-houses, kitchen garden, Rose garden, and seemingly (by reason of the plans of the garden architect) extensive pleasure-grounds. Then there is a model farm and dairy, and some excellent meadow-land, in which were some well-bred cows.

The pleasure grounds for the greater part consist of a belt or girdle, and the meadows are encircled by this. Longer walks are thereby obtained, which one would not expect to find, and there is plenty of water. The grounds are very undulated, and from the house with its pretty front garden, there are several distant views. Mr. Deacon has charge of the establishment, excepting the Orchids, and he has overhauled the Rose garden, and effected other improvements. The gardeners are well backed by the enthusiasm and interest which Mr. Chamberlain himself exhibits. During the summer months the meadows are frequently lent as a playground or camping-place for Sunday schools, religious, and other societies in and around Birmingham, and it was so on the occasion of my visit. P.

Royal Garden, Kew. This flower measured in breadth 18 inches, in length 23 inches, and was furnished with a tail of 34 inches in length. It was shown as *A. grandiflora*, but was afterwards determined to be *A. gigas*. At Kew, the species is grown in the Victoria-house.

FALKLAND PARK, SOUTH NORWOOD HILL.

(Continued from p. 49.)

THE fine corridor (previously briefly referred to) connecting the plant-structures, was attractive with flowering and foliage subjects. Here were *Solanum jasminoides* perfectly wreathed over with its pretty bluish-white flowers; *Pelargonium* 7 to 8 feet in height, covered with flowers; *Heliotropes* much higher, and as profusely bloomed; *Passiflora Imperatrice Eugénie*, *P. Comte Kessiloff*, a very free-flowering garden hybrid, stamens purple, tipped with white, and light purplish petals; *Fuchsias* in good variety and well-flowered; *Lasiandra macrantha*, *Tropæolum Ball of Fire*, with its glowing scarlet

Cherries on trees in pots, and planted out, fruit fairly well here, the varieties being May Duke and Governor Wood. Brown Turkey Fig is bearing a fine crop of fruit.

In the vinerie here (some sixty years old) Black Hamburgh and Muscat of Alexandria Grapes were in good condition, carrying good crops of useful bunches; the Vines are treated on the long-rod system. In this house are planted some vigorous young Vines, which will in time take the place of the older ones. Tomatoes to make a succession crop were also noted here, the varieties grown being Conference, Perfection, and Challenger. In the structure were some good Plum-trees in tubs. Early Norman was bearing a wonderfully fine crop; other sorts were Denniston's Superb, Grand Duke, and Green Gage.

THE OUT-OF-DOOR GARDENS.

On the west of the mansion are extensive beds, planted chiefly with the best-named varieties of *Rhododendron*, which flower well here, *Azalea mollis*, *A. pontica*, the Ghent varieties, and small choice Conifers, one of the hardiest and most

beautiful being *Cupressus pisifera aurea*, now appearing as if bathed in gold.

The hardy flower garden, informal in outline, and nodulating in design of ground, lies between the terrace garden and the lake. The system of planting is that of bold grouping, giving fine effects. Around the margin of the lake are massive clumps of rock-work, fashioned by the hand of man like unto natural rocks, and here many of the more choice hardy herbaceous and alpine plants and dwarf flowering shrubs are at home. *Iberis corcefolia* present sheets of the purest white; masses of *Primula japonica*, crimson and white, on either side of the water, suggest the idea that this fine species deserves similar extensive cultivation in many gardens. A mass of the showy *Stenactis speciosa* produces a fine effect with its purplish flowers, then *Heleium pumilum*, *Campanula carpatica*, *C. c. alba* (the two latter presenting a feast of blue and white), and *Chrysanthemum maximum* claimed attention. The lake itself is attractive in the season, with great numbers of the white Water Lily, and a large hybrid form, unknown, with brownish blotched leaves and large primrose-coloured flowers, 6 to 7 inches across. That noble hardy herbaceous plant, *Spiraea Arancua*, was very noticeable with its plumes of white flowers. The Rock Roses and Gum Cistus were very effective. Noticeable, too, were bold groups of *Pæonies*. That fine Pink, Her Majesty, and quantities of *Carnations*, in all the best varieties, are cultivated.

The terrace garden, which overlooks the hardy flower garden, consists of beds mostly planted with half-hardy plants; it is surrounded by a low balustraded wall, on the piers of which stand handsome vases, which, in the season, are filled with flowering plants. But what a contrast this terrace garden, with its formally trim and neat planted beds, presents to the hardy flower garden, with its informally, ever-interesting, and bold system of grouping in planting, furnishing a decidedly practical object-lesson, distinctly in favour of the latter system of garden embellishment. The turf in this quarter is filled with *Daffodils* and other spring flowering bulbs, which, in their season, must present most attractive features.

Beyond the lake are extensive beds of *Rhododendrons* and other flowering shrubs; and in a quite corner two tennis courts are laid down. On the west side is a wood of Birch and Oak, "faced-up" with a border of *Rhododendrons*, through which good thriving clumps of *Lilium auratum* are largely planted, giving quite an attractive feature and happy contrast. In other portions of the grounds the system of planting hardy Lilies amongst the shrubby beds is one that merits attention. The east side of the hardy flower garden is backed up by a shrubby and large border of *Roses*. In my perambulations I noted what, in its way, is one of the features of the place, namely, some bold clumps of *Erica carnea*, which in the spring form beautiful masses of bloom, lasting a long time in good condition. The varieties of *E. vulgaris* are also largely represented, *E. vagans*, *E. mediterranea*, and *E. m. alba* are also extensively grown.

A good strain of *Dianthus Heddewigii* was remarked in several beds, the flowers large and colours brilliant, ranging from the purest white to the richest crimson, and many beautifully laced or striped. For bedding purposes they are valuable, retaining their beauty during the entire summer, also furnishing elegant flowers for bouquets.

The *Chrysanthemums* (which formed quite an avenue), some 1200 being grown, principally incard and Japanese of the best sorts, looked in capital condition, with stout firm shoots and healthy leather-like foliage. Orchard fruits, such as Apples, Plums, and Cherries, are grown, and in the generality of seasons afford good returns.

Veg-tables are well grown here; and excellent New Intermediate Carrots, Cranston's Excelsior Onions, Oxonian Leeks, and other kitchen-garden crops were noted.

In conclusion, it is but bare justice to state that Falkland Park, which stands in the front rank of

gardening establishments in the neighbourhood of London, is well managed in every department by the gardener, Mr. A. Wright, who has had no small share in the re-modelling of the place. The photograph, of which our figure is a representation, was taken by Mr. Wright. J. B.

## WILD GARDENS AND PLEASURE GROUNDS.\*

In most private gardens a place might be found in which some of the rarest and best of our wild flowers and plants might be grown, and where they would greatly add to the beauty of the grounds, be they large or small.

There have been so many hardy plants introduced to this country during the last few years from most parts of the globe, that careful discrimination is required before making a selection. There need be no great outlay or preparation, inasmuch as plants to suit all soils and positions may be easily obtained from our local nurserymen, by which many charming effects can be produced in a limited space. Nature is our best teacher, and the more we adopt of Nature's methods the better effect shall we produce. I will endeavour to give you a brief idea of what constitutes a wild garden. It matters not whether it be field, wood, bank, or streamlet, though I prefer watered dells, because a greater variety of plants will thrive there. I purpose taking some of the stronger-growing plants first, and as I cannot enumerate all I should like to do, so I must confine myself to the principal ones. The Bamboo ranks first for its graceful beauty when planted with its roots in or near the water. *Arundinaria japonica* (*B. Metake*) is one of the most free-growing kinds. It is evergreen, and soon forms a good mass, growing with us from 18 to 20 feet high, in a rich moist soil. *Thamnocalamus Falconeri* is a very graceful one, and grows higher than *B. Metake*, the canes belong strong enough for fishing-rods (I believe this is often sold for *Arundinaria falcata* or *gracilis*). Another good variety is *Phyllostachys viridi-glaucescens*. This, also, is a very rapid grower, and requires plenty of room. There seems to be some doubt about the nomenclature of many of the varieties, and it is a pity the subject cannot be investigated, and the hardy ones clearly pointed out. I think Mr. Mitford, Batsford Park, Moreton-in-Marsh, could enlighten us on the subject, for I believe he has nearly all species in cultivation. [A classification of hardy Bamboos, by Mr. W. J. Bean, who has charge of the Arboretum in the Royal Gardens, Kew, was published in the *Gardeners' Chronicle*, February 24, 1894, and subsequent numbers. Ed.] *Arundo donax* and *A. d. variegata* are good companions to the above.

A hold effect on the margin of water may be made with *Gaunera manicata* and *G. scabra*, with several of the *Rheum* family, such as *R. emodi*, *R. officinale*, *R. palmatum*, and *R. p. tanguticum*, the last-named makes a very handsome specimen for a lawn. A gentleman sent me some seeds of a variety of *Rheum* from the Himalayas some years ago, and it is one of the most effective I have, the leaves almost vermilion in a young state, and they keep their colour well. He also sent me a variety of *Pulsatium*, at the same time, with larger flowers than any I have seen elsewhere. Another fine plant is the Giant Parsnip (*Heracleum giganteum*), which makes a very striking object. For creating a great show in a short time, *Polygonum cuspidatum* should be planted; it grows well in partial shade, and looks like a mass of snow when in bloom, being admired by all. Care should be taken not to allow it to smother other things. It should be kept to itself as much as possible.

A very beautiful plant, not very generally known, I think, is *Oreocome Candollii*. I can confidently recommend this for a shady spot. In appearance, it is like a gigantic Maidenhair Fern, and to keep it in full beauty it should never be allowed to bloom.

\* Extracts from a paper by Mr. J. D. Nanscawen, Whiteway Gardens, and read before the Devon and Exeter Gardeners' Mutual Improvement Association.

The plant is quite herbaceous and perfectly hardy; an introduction, I believe, from Japan. [*Himalaya*. Ed.]

I need hardly say that the stately Foxgloves should always find a nook in the wild garden. The endless variety of colours, from pure white to deep purple and yellow, make it valuable, especially where it is not naturally common.

A very pretty combination is made by throwing together a few or many old stools or roots of trees, and partially covering them with soil. Allow a *Clematis* to ramble over them, and plant amongst them *Gladiolus Breuchleyensis* and *Anemone Honorine Jobert*.

The fast-growing climbing *Roses*, such as *Dandee Rambler*, *Ayrshire*, *Félicité-Perçée*, are useful for the same purpose, and no doubt the new *Crimson Rambler* also. The everlasting Pear, *Lathyrus latifolius*, *L. alba*, *L. rotundifolia*, and *L. Sibthorpii* are equally suitable; and the *Bindweeds*, *Calyptegia pubescens*, and others. The last-named will become a "white elephant," if not well looked after; it is almost impossible to eradicate it when thoroughly established. There is no limit to the pretty effects that can be made from such a wealth of plants, if taste and judgment are exercised.

Where it will succeed, *Tropæolum speciosum* should not be omitted. It makes a most gorgeous sight when in full bloom, and runs and flowers very freely over plants and shrubs, covering them with masses of brilliant scarlet flowers. If it should not succeed in one position, try another, or sow seeds in different places, and it will soon indicate the situation that suits it best. *T. tuberosum* and *T. pentaphyllum* are also good. Good yellow flowering-plants are *Achillea eupatorioides*, which continues very long in bloom; *Solidago* (*Golden Rod*), *Senecio japonicus*, *Telekia speciosa*, *Harpalum rigidum* (*Prairie Sandflower*), *Helianthus* (*Perennial Sandflower*), and *Cephalaria alpina*.

Of the blue flowers there are the *Echinops* (*Globe Thistle*), *Eryngium*, or *Sea Holly*, *Cichorium*, or *Chicory*; *Aconitum* (*Monk's Hood*).

The following are white-flowering plants:—*Aepholdes*, *Solomon's Seal* (*Polygonatum*), *Chrysanthemum latifolium maximum* (and the new variety of maximum being very dwarf, is far superior to the old one), *Anemone aponica alba*; and, above all others, *Romneya Coulteri* (the Californian Tree Poppy). It is a gem of the first water; and to see it unfolding, day after day, a number of its magnificent pure white flowers, the golden stamens almost forming a ball in the centre, each flower lasting a week, and being 6 or 7 inches in diameter, is a sight not soon forgotten. The plant is still more valuable, because it flowers so late in the season, and the flowers are uninjured by several degrees of frost. It should be given a mulch in winter, in case of sudden and severe frost.

Of red flowering-plants there are *Bergamot* (*Monarda*), *Purple Loosestrife* (*Lythrum*), *French Willow Herb* (*Epilobium*): this requires care in planting, as it soon gets out of bounds. *Spiræa*, *Bleeding-Heart* (*Diclytra*), *Flame-flower*, or *Red-hot Poker* (*Tritoma*), a plant which requires good rich soil; *Rose Campion* (*Agrostemma*), *Polygonum orientale*, an annual, but so good and effective that it is worth the trouble of sowing and planting each season—it requires a good rich soil. *Poppies* *Papaver orientale*, *bracteatum*, and various hybrids, in a mass, is a sight worth seeing, and they are telling plants in the distance. In recommending *Oriental Poppies*, I would add that not only are they floriferous and most telling in colour, but they all have elegant foliage. *P. bracteatum* particularly so. The *Mexican Thistle* (*Erythrosea conspica*), is a very ornamental plant, and the large *Scotch Thistle* growing 6 to 8 feet high, is very stately. I also wish to say a good word for the double pink *Soapwort* (*Saponaria officinalis*), which makes itself at home anywhere, and soon forms a colony for itself.

Foliage plants suitable for grouping are endless. Of dwarf plants there are *Plantain Lily* (*Funkia*). Large-leaved *Saxifragas* (*Megasea*). *S. peltata*, this is a very handsome species. *Bear's Breech* (*Acanthus*). *Blessed Thistle* (*Carduus benedictus*). Of

taller subjects Adam's Needle (Yucca), Giant Fennel (Fenja), Plume Poppy (Bacconia), Spiræa (A. tilbe rivularis). The Honey Flower (Melianthus), has exceedingly handsome foliage. Ricinus Cambridgensis, is a grand variety of the Castor-oil plant, and as you know, an annual.

Where room can be found to plant the Peruvian Lily (Alstrœmeria), it should certainly be tried, I find a mixed peaty soil suits it best.

The Pœony in both double and single varieties of the herbaceous section, make very handsome plants for grouping in the wild garden they should be in a sunny position. The Tree Pœony also must not be forgotten; they are grand subjects for cutting, but do not last so long cut as flowers of the herbaceous section. They are not only bright, cheerful, and lovely in form and colour, but they are beautifully scented as well.

In wild gardening, bulbs should play a very important part. Where a good breadth of grass can be had, it is surprising how effective large masses of Daffodils and other bulbs are when in bloom. The different varieties of Daffodils should be planted separately, Aconites, Snowdrops, Scillas, Snowflakes, Anemone apennina, A. fulgens, A. stellata, &c., are very lovely when grown amongst the Daffodils in grass. Again, the ground above the bulbs can be filled with masses of Cowslips, Oxlips, Columbines, &c. It would be no detriment to the grass, as it could be cut for hay if required. We do this at Whiteway.

I have said nothing yet about Ferns for the wild garden. A whole volume might be written on them without exhausting the subject by those who cultivate and care for them. There is no place too bleak or exposed for them. In such places Ferns will hold their own, and add a wealth of beauty; and amongst our own lovely Ferns, those of other countries grow side by side in the happiest condition. New Zealand, America, and other countries contribute year after year fresh subjects for our hardy gardens. Cyrtomium Fortanœi, Davallia novæ zelandiæ, Lomaria Boryana (magellanica), Pteris scaberrima, and many others grow in the greatest luxuriance. From the far Alps also, many of them adapt themselves to their new home as if growing in their native habitat. One can plant Ferns in such shady places as few other plants will grow in. Nothing can be more graceful and refreshing to the sight than a collection of healthy Ferns, and one need never tire in admiring the individual beauty peculiar to each separate variety.

I have not spoken of Tree Ferns, as they require more care, and our treacherous climate is liable to injure them severely, although I have known stems which, thrown to the rubbish-heap as dead, after twelve months have shown signs of vitality, and have been potted and housed in a cool-house, where they are now plants that one may well be proud of. This teaches us not to be too ready to discard them. Wherever a warm sheltered spot can be found, I strongly recommend Tree Ferns to be planted, and surely there are many places where they could be tried.

### DENDROBIUM WARDIANUM.

WITHOUT doubt, difficulty is experienced by some cultivators of Orchids in growing and flowering this beautiful species, and preserving it in good health for any great length of time. It is a fact well known among growers of experience, that an established plant of D. Wardianum is a rarity at the present day. By the term "established," I do not mean the being in the cultivator's hands for two or three seasons, but a plant which has thriven for eight or ten years, and accordingly produces each year as good pseudo-bulbs equally well bloomed as it did the first year or two after its importation. Probably there are instances of plants which grow on unchecked, but I have never seen or heard of such successful culture. Although our methods of Orchid-culture have much improved of late years, some species still remain that try how one may gradually deteriorate, and so

far as my experience goes, D. Wardianum is one of them.

I should say to your correspondent, Mr. Day, respecting his plant, that it would be advisable for him to obtain several imported pieces, planting some in baskets, and others in shallow pans, to be suspended from the roof, others being potted and stood upon the stage, and then to adopt that method which affords the best results. I do not think that it is so much a matter of basket or pot as of light, heat, air, and moisture whilst in growth, and the thorough ripening of these growths when this is completed. The following general directions will serve as a guide to his treatment of his plants, still much will have to be left to the cultivator's judgment. During the growing season, the temperature of the East Indian-house or a humid plant stove, where air is admitted on all favourable occasions, is probably the best place for this species, regular supplies of water being applied at the root till growth finishes for the season. When the new pseudo-bulbs have attained to their full size, root-waterings should be gradually withheld, and the plants placed in a vinery, if such accommodation is at hand, where the Grapes have been gathered. Here the plants will pass from moderate shade to full sunshine by degrees; and throughout the season of rest, a very small quantity of water will be required if the pseudo-bulbs were properly matured, only just enough to prevent their excessive shrivelling. At the present time, the flower-buds are becoming prominent; the new pseudo-bulbs and the plants will therefore be gradually enured to greater warmth. W. H. W.

### ORIENTAL LILIES.

THE leading writers on this fascinating subject are Mr. Ewee, Dr. Wallace of Colchester, and Mr. J. G. Baker of Kew. To Mr. Wallace we are mainly indebted for what may expressively be termed their analysis; to Mr. Baker for their classification. I have for many years been a cultivator of eastern Lilies, and I have in my garden all the more important varieties, including the great Himalayan Liliun giganteum. This magnificent Lily is found on the lower slopes of the Himalayas, at an elevation of 8000 feet. It belongs to the sub-genus Esulirion, to which also L. longiflorum, Wallichianum, nepalense, and candidum belong. Dr. Wallace, in a comprehensive contribution to the *English Flower Garden*, asserts that giganteum literally revels in manure, but I know from sad experience that a single application of this stimulant in liquid form was found sufficient to undermine the vitality of one of the finest specimens I ever possessed. Mr. Harry J. Veitch is strongly of opinion that this substance should be entirely withheld from L. giganteum, and I feel certain that he is right. All that oriental Lilies require, as a general rule, for their successful culture is peat or leaf-mould, with a considerable amount of sand, whereby adequate drainage is secured. Those who give them the kind of treatment essential for Rose-culture will soon discover their mistake. My near neighbour, Mrs. McDonall, of Logan House, is an enthusiastic cultivator of Lilies; so also is another kind friend, the Duchess of Sutherland, to whom I recommended some years ago the special varieties grown so successfully at Trentham by her Grace's head gardener, Mr. Blair. They are not an equal success at Danrobin Castle in Sutherlandshire, though I cannot doubt that they receive sufficient attention from Mr. Melville, who assuredly must be conversant with their requirements, seeing that he has the superintendence of millions of bulbous flowers, some of which, and notably the Snowdrops, are of world-wide fame. If oriental Lilies, as the duchess asserts, do not succeed so well at Danrobin as they do at her Grace's Staffordshire residence, it must be entirely owing to the nature of the soil.

Mrs. McDonall, of whom I have already spoken as a Lily cultivator, is especially successful with L. auratum and Kramerii, the latter of which I have always regarded as difficult of culture. I have an

idea that its bulbs which are, compared with others, sufficiently small, have a peculiar attractiveness for insects, by whom they are destroyed. It is also probable that it requires a special soil strongly impregnated with peat and fibrous mould. At Logan House, several bulbs of this beautiful Lily, originally called Kramerianum, were obtained by Mrs. McDonall from Messrs. R. Wallace & Co., and planted in borders between the mansion and the garden formerly occupied by Azaleas, which had succeeded admirably, and flowered luxuriantly there. Every one of them has proved, *mirabile dictu*, a gratifying success. Never elsewhere have I seen L. Kramerii in flower, and I have an idea that its successful cultivation is exceedingly rare. As much may be said of the open-air culture of an attractive Lily of more recent origin, Liliun sulphureum, primarily named by Mr. Baker, Wallichianum superbum. I tried it in my garden, but very soon discovered—at the period when its obvious duty was to appear above-ground—that it required "bottom-heat," and therefore had it, in company with nepalense, forced in a conservatory. Neither of these Lilies is, even under such atmospheric conditions, remarkably prolific; the latter contenting itself generally with the production, not without difficulty, of one solitary flower of unique complexion; and for this and other reasons, among which is their expensiveness, I cannot venture to recommend them for general cultivation. They should be cultivated, if only for the sake of their distinctive beauty, by affluent specialists, to whom expense is a secondary consideration. I am, however, in a widely different category; my financial resources very frequently putting the brakes on my aspirations, and therefore I have to satisfy my passion for the culture of the noblest of Eastern flowers with L. davuricum (incomparable × erectum) in June; L. candidum, excelsum, and dalmaticum in July; L. giganteum and longiflorum Harrisii in the beginning of August; L. auratum, Henryi, chalcadonicum, and L. Browni in September; October being glorified—I can use no term less expressive of its combined splendour and ineffable sweetness—by Liliun speciosum. It was my first love among the Lilies, and it will assuredly be my last. It has not the gorgefulness or imperial aspect of Liliun auratum, whose loveliest form is the stateless L. a. virginale; it does not glow in the summer twilight with the splendid impressiveness of L. candidum or L. longiflorum, but in absolute perfection of substance, of form, of complexion, and of fragrance, it stands supreme. In no family of Lilies can I discover such a strikingly artistic contrast as that which exists between Melpomenæ and Kæzari, Liliun Browni, or longiflorum Takes mi, however beautiful, would not constitute such a picture, if placed beside the Catanian dalmaticum. David R. Williamson.

### THE VERSAILLES SCHOOL OF HORTICULTURE.

THERE is more work done at the École Nationale d'Horticulture than most persons imagine. If a new method of cultivation is being discussed, a scientific discovery, or an improved instrument, it is submitted to examination and experimentation before the eyes of the students—by them and for them. Situated on the site of La Quintinye's kitchen-garden at Versailles, according to a decree passed on December 16, 1873, at the proposal of M. Joigneaux, the school has so far received twenty-one increases, making a total of 751 pupils. All branches of horticulture as well as the applied horticultural sciences are here taught. The pupils acquire practical experience in executing, under the direction of qualified superintendents, all the cultural work undertaken by the school.

The total area of the school is about 22½ acres (9 hec. 40 ares), of which, 3 acres are allotted for fruit-growing; 2½ acres for kitchen-garden, four-fifth acre for the Botanical School, seven-tenth acre for greenhouses, ½ acre for a nursery-school, and the

remainder for buildings, pleasure gardens, walks and terraces, the arboretum, &c.

The first director and real founder of the École was the lamented and respected M. Hardy, a monument to whom, placed not far from that of Li Quintinye, will soon perpetuate his memory. His successor, M. Nanot, continues the work which was so well begun, and always endeavours to make continual progress. Thus, he has asked and obtained the foundation within the precincts of the school of a laboratory for horticultural experiments, entrusted to the care of the distinguished agricultural experimentalist, M. Petit. He has also caused to be added a workshop where the pupils are required in turn to make or to repair most of the instruments and gardening tools used at the school.

## COLONIAL NOTES.

### CHRYSANTHEMUMS IN HONG-KONG.

*CHRYSANTHEMUM indicum* is one of the wild plants of Hong-Kong, and a very pretty plant it is. Its flowering season is November, and during that month if you happen to go for a ramble over the hills, you will come across it with its bright yellow flowers peeping above the long grass in many and varied situations. Sometimes just a single plant, at other times dozens of them, but whether one or more, always attractive. Here you find it in a sunny, dry situation at the top of a hill, and there in a shady, damp position at its base. As you gather a flower and look at it, you cannot but be struck with astonishment at the marvellous monstrosities which have been produced from it and its ally, *Chrysanthemum sinense*. It is of these monstrosities as grown in Hong-Kong that I wish to write a few words. *Chrysanthemums* are just as great a feature here during the autumn months as they are at home. Everyone who makes any pretension to gardening whatever, has his show of these flowers in the proper season.

As most flowering plants have to be cultivated in pots, owing to the limited amount of ground suitable and available for horticulture, the national emblem of Japan is one of the best plants that can be grown to give a good return for the labour bestowed upon it. Its flowering season is also in its favour, as it is a time when most of the tropical plants are past flowering, and the winter-flowering annuals not yet in bloom. The best collection that I have seen in this part of the world was grown by Mr. Dorabjee, a wealthy Parsee gentleman who takes a special interest in horticulture, at his establishment in Kowloon—the peninsula immediately opposite and belonging to Hong-Kong. When they were in bloom, Mr. Dorabjee kindly invited the public to see them, and accordingly I paid a visit to his garden on November 21. The collection was made up of about 500 plants in forty-one varieties, including the following kinds, incurved, reflexed, Japanese, Pompon and Anemone-flowered. None of them were named—in fact, there are no named varieties in Hong-Kong; they are simply called No. 1, No. 2, and so on. This is a favourite way the Chinese have of indicating varieties, No. 1 standing for the best variety, No. 2 for the next best, and so forth. Mr. Dorabjee told me that he brought nearly all the varieties from Japan last year, as those which he previously had were destroyed by the 1894 typhoons. The largest of the plants were about 3 feet across, and carrying upwards of forty blooms. Every plant was perfectly grown, being furnished with foliage from the flowers to the pots, and staked like specimens at an English exhibition. One of the best of the incurved varieties was a sulphur-yellow, 5 inches across, and 4 inches deep—very compact. Another good incurved was a creamy-white, similar in all respects to the former, except in colour. Amongst the Japanese was a very fine white, with very broad petals, 7 inches across, and 4 inches deep. In the same class was a lovely pink, not quite so large as the white, but very striking. Of course, it would be useless to mention

the varieties individually, but I will just jot down the colours of some of them—bronze, purple, claret, lilac, crimson, orange, and chestnut of various shades.

The method of cultivation is as follows:—The cuttings are taken off in February, and put into pots, 6 or 7 inches, several in a pot, in fine Canton soil, or Canton soil and sand. Canton soil is mud obtained from the banks of pools near to Canton, and is largely used in the cultivation of plants in Hong-Kong after having been first dried. As soon as the cuttings are rooted, which is about the end of February or beginning of March, they are put into Chinese 7-inch pots, in a mixture of fine Canton soil and pig's-hair, one in a pot. These Chinese pots are very unlike English pots; they are 7 inches in diameter at the top it is true, but they are only about 3 inches deep, and saucer-shaped. The plants are transferred to their flowering-pots about the end of May, the same kind of compost being used as for the first potting. The pots generally used for this purpose are 14-inch and 16-inch Chinese. They are different in shape to the 7-inch pots, as well as different from the English flower-pot. The 14-inch pots are 1½ inches in diameter at the top, and 12 inches at the bottom, the depth being 7½ inches. The 16-inch pots are 16 inches across the top and 13 inches across the base, having a depth of 9 inches. When the plants are put into these pots, the pots are only half filled with soil; as they become filled with roots more soil is added, until only sufficient room is left at the top for watering. The first top-dressing takes place in July, the second in August, and the third and last, in September. After the first top-dressing, the plants are trained and staked; of course, all superfluous growths are removed as soon as they make their appearance.

The flower-buds begin to show in September, and all with the exception of the crown-buds are removed in the large incurved and Japanese varieties. Liquid-manure in the form of urine is given to the plants after they have become established in the flowering-pots, and this is continued up to the time that the blooms open. The plants are grown in a position where they get the sun for three or four hours a day; if they have the sun all the day long it is impossible to keep the leaves on them. Strict attention has to be paid to watering; in the summer time this operation has to be done three or four times a day to insure success. Mr. Dorabjee's gardener kindly obliged me with the above remarks on cultivation, and it was very evident from the plants which I saw that he knew the way to grow *Chrysanthemums* better than anyone else in Hong-Kong. *W. J. Tutcher.*

### FILMY FERNS FOR THE WARDIAN-CASE.

The Wardian-case as a room decoration enjoys far less popularity than it deserves, and this is due to the fact that in most cases (we beg pardon, instances), although they are very pretty when first planted with Ferns, these speedily become drawn and lose thereby their natural grace, while the more rapidly-growing species overwhelm the others, forming a confused and unsatisfactory growth, which, short of very drastic measures, is incurable. The faults here are two, viz., a badly-lighted position for the case itself, and injudicious selection of the Ferns employed, and since the mere fact of the installation of a case inside a room, with the windows usually partially veiled by curtains, renders it next to impossible to afford adequate light for healthy growth of ordinary Ferns, it is clear that we are restricted to species which can thrive with a minimum of this vital essential.

These Ferns are the Filmy Ferns, one and all of them marvels of delicate beauty, and amongst which there are a number of hardy ones, as defiant of frost as the wild Ferns of our native hedgerows and commons. Another advantage possessed by these Ferns is their evergreen nature, the fronds of some of them lasting for years, so that they are just as beautiful in the depth of winter as in the height of

the growing season. Finally, to sum up their virtues as room plants, they enjoy a peculiar immunity from vermin, and if properly installed at the outset, will succeed for years with the smallest amount of trouble to the cultivator.

As regards the conditions upon which future success depends, the case, the principle being always the same, whether it be an oblong case proper or a round pan covered with a bell-glass, must first be thoroughly well drained. Usually there is a double bottom, the upper one being pierced, and a vent-pipe being provided at one end of the case for the exit of surplus water. Over all the holes thus provided hollow pieces of clean broken flower-pots should be placed, and the spaces between these filled up with other pieces arranged as hollowly as possible; a layer of dead sphagnum-moss should be spread over this in sufficiency to prevent the soil from settling down and choking the crocks (broken pots). Some best brown Orchid peat should then be broken up into rough lumps, the coarse refuse, roots, &c., being spread over the sphagnum moss, the rest can be heaped up so as to form a kind of mound, level with the edges of the box of the case all round. A very liberal allowance of coarse silver-sand should be sprinkled into the peat, as this is done so that it has a grey appearance. Provide next a number of rough pieces of sandstone, and embed these well into the compost so as to form a rude rockery, and our ground is now prepared. I well remember the first Fern-case of this class I made. I obtained some long pieces of sandstone, and built up a sort of Druidical Kilt Coty House, a fine moss-grown slab resting on two uprights, with charming effect, and upon this slab, strange to say, our first plant of *A. f. f. Victoria* made its appearance as a stray. The next thing is to water the whole erection thoroughly until it is quite soaked, when any weak points in the construction will manifest themselves. This settlement, by-the-by, should be allowed for in building up the mound, as this saves meddling with the soil while wet, which should always be avoided as far as possible. On this account planting is better deferred for a day or two, though this is not absolutely necessary.

I now come to the question of the tenants, the domicile being thus prepared for their reception, and these of course depend upon the size of the bell-glass or case concerned. Our native species of Bristle Fern (*Trichomanes radicans*) is certainly best adapted for fair-sized cases, but a small plant will form a very pretty object even in a 12-inch bell-glass; while the small *Hymenophyllums*, *H. tanbridgensis* or *H. Wilsoni* may be used to cover the soil under its shade with their much-smaller frondage. *T. radicans* has afforded some half-dozen distinct varieties, all of which are handsome. Besides the normal, there are *T. r. Andrewsii*, *cambricum*, *crispum*, *dissectum*, and *dilatatum*, the last of which is a splendid large form, and should find a post of honour on the top of the rockwork. A prolific form was sent us some years ago from Dublin, but though we raised a clump of plants from the little ones with which its fronds were dotted quite as freely as *Asplenium bulbiferum*, the progeny have so far been barren; this, however, with us is a small, dense, neat form—a capital foil to the others. The green translucent fronds of these *Filmy* are exquisitely lovely. *T. reniforme*, an utter contrast in form, since the fronds, instead of being delicately cut, recut, and cut again, are simply slightly-frilled round discs the size of five-shilling pieces on stalks an inch or two high. This grows very slowly, and though not so hardy as *T. radicans*, thrive with us for years in a cold frame, and was repeatedly frozen, though last winter proved too much for it. Indoors, however, it would be perfectly safe; and sets off its relatives to great advantage, besides being very pretty in itself. *Hymenophyllum demissum* is a delicate slender-growing filmy, much larger than our native species, and amenable to precisely the same treatment as the others.

Now all these Ferns possess creeping root-stocks, very thin in the *Hymenophyllums*, being quite thread-like in one or two indigenous ones, and

thicker in the *Trichomanes*, whose travelling root-stocks, densely covered with rich brown hair-like scales, resemble exactly the trimming known as chenille. As these root-stocks are purely surface growers, and attach themselves to rocks, the roots proper being sent down through the chinks and crevices into the soil beneath, we must humour this peculiarity by our mode of planting. The best way, if we start with small plants, i.e., only an inch or so of root-stock, with a frond or two attached, is to cut a number of wooden pegs, and peg the pieces with the fronds in their natural upright position, either into the soil itself, or gently hedged between two pieces of stone—anyhow, fix the plants firmly. If it

task being practically over. The moisture condensing in the glass finds its way into the soil again, and if the door be kept close, it will not need watering more than half-a-dozen times per annum. It may be as well to state here that growth at first is very slow, but once they have taken hold, it is astonishing how soon the emerald-green transparent fronds assert themselves, the chenille-like roots meanwhile creeping about and over the stones until they have quite invaded them. So far, so good. But what, my experienced filmy Fern friends will say—what about the *Todeas*? Well, I have left these to the last as a *bonne bouche*, and because they can be planted with greater ease, belonging

for years down to case size, and form little gems of the first water. *T. pellucida* is less dense in growth, and very distinct. Treatment the same. Both stand cold at zero. *T. grandipinnula* is like a grand *Trichomanes radicans*, with the *Todea* habit of growth. Its genesis is a mystery, but space precludes going into that, and its knowledge is not essential to good culture, as it is as easily grown as the others, but in our experience it is not so hardy, last winter having all but killed our only specimen. When these *Filmies* have been grown successfully, there is a host of others, rarer and very distinct, but too expensive for the 'prentice hands, for whom we write. *Chas. T. Druery, F.L.S.*

FIG. 11.—ODONTOGLOSSUM C. STEDL. (SEE P. 79.)

be a clump, it is best to bed it well upon the soil, and insert pieces of sandstone between the fronds, covering the rhizome or root-stock as little as possible. Do this until your case is neatly dotted over with pieces; then prepare a mixture of peat, rubbed fine between the hands, and coarse silver-sand, half and half, and after spreading this thinly over the surface, drench it in with a vigorous application of water from a spout, so that it is washed well among the roots, and repeat this operation until all the plants are firmly bedded without the rhizomes being buried. Now polish up your glass inside and out, and place your case as near the window as you can get it—i.e., a north or east window, where the sun has no power; leave it severely alone for a month or two, your part of the

to the category of crown or caudex Ferns, that is, they have no travelling root-stock, but grow from a centre, shuttlecock fashion, so that the ordinary procedure of planting applies. The composts and drainage, however, must be as above described. Another reason for leaving them until the last, is also that the *Todeas* are large growers, and I started by treating of more or less permanent planting. The members of this family available are three, viz., *T. superba*, *T. pellucida*, and *T. grandipinnula*. Of these, *T. superba* is the finest, it grows splendidly in a case with the same kind of treatment as that given above. It should have a central position in the case, and ample space. I have a plant measuring nearly 5 feet across, demanding, of course, a frame rather than a case; but plants cramped in pots may be kept

## THE WEEK'S WORK.

### PLANTS UNDER GLASS.

By Jno. McINTYRE, Gardener, Woodside, Darlington.

**SOILS AND TEMPERATURES.**—Complete the preparation of soils for the general repotting of stove and greenhouse plants. If a good potting-shed is available, there need be no difficulty in obtaining soil in good condition. Much injury to plants is done by the use of soils not properly prepared; and it is important that such work should be done before the busy season commences. In warm-houses the temperatures may now be raised 5°, in order to stimulate growth. I like to see all stove plants nicely on the move previous to giving them their annual repotting, and particularly specimen plants,

**CLERODENDRON BALFOURIANA.**—Where specimen-plants of these are required to flower during April and May, they should now be started, and as soon as they commence to make growth, they may be re-potted. A compost in which Clerodendrons do well, consists of two parts good fibrous peat, one part rich loam, one part dry cow-manure, which should be rubbed through a 3-inch sieve, and one part coarse Raigets sand. The peat and loam must not be broken up too fine. Excellent specimens can be grown in 16-inch pots, and there is no necessity to exceed this size. It is much better to reduce the plants annually, and re-pot into those of same size. It is essential that the pots and crocks be made thoroughly clean. Clerodendrons as specimen-plants are invaluable for exhibition purposes, and for cutting from; and they will repay the extra care bestowed in doing them well. As soon as the plants break into growth, all superfluous wood should be removed. If the plants are on balloons, they must be cut well back in order to give room for the coming season's growth, but if trained on pillars or roofs, severe pruning will not be needed. The Clerodendron does not need a very high temperature at any time, and contrary to the assertion of some growers, the finest specimens are produced when given a moderately warm house without bottom-heat. A maximum temperature of 70° will suit them until coming into full bloom.

**GARDENIAS.**—Push on these by placing them in the warmest part of the stove, and give them a sprinkling of a more reliable fertilizer once a week. It is essential to keep Gardenias remarkably clean, or otherwise their usefulness and beauty are marred. They are rarely given to us hasz that they cannot be given in July. Black-fly may be killed in strong soap-suds at a temperature of 90°. For mealy-bug add a wineglassful of petroleum in the mixture.

**CHRYSAANTHEMUMS.**—All cuttings possible should now be got in, but cuttings of some varieties may be yet unobtainable. The best time to propagate, in order to get large blooms, is in December, although good results will follow if they propagated any time in January. Use thumb-pots, and insert the cuttings singly, there will then be no check. Use for compost good leaf-soil two parts, and one part wood-ashes. Place a mound of silver-sand where the cutting is to be inserted, that it may run into the hole made for the cutting. They should be kept near the glass in a cool house, but in all cases it is desirable to have them so placed that they can be examined daily, and all decayed leaves removed. In cold frames, during severe weather, it is sometimes impossible to do this for weeks together.

**HARD-WOODED PLANTS.**—Look over these, and do the necessary training. In the case of Ericas, a few stakes as possible should be used, as a large quantity of stakes will destroy many of the fine roots, and they detract from the appearance of the plants. Use few stakes, and a network of green thread, now in the market for this purpose. To this network of thread the trainer can regulate the shoots, and when finished, the whole is neat. Specimen Azaleas can be perfectly trained with thread without stakes. All Indian Azaleas intended for exhibition purposes during the spring, should have the shoots regulated now, in order that the leaves may assume a natural appearance before the plants flower.

### THE HARDY FRUIT GARDEN.

By G. WOODGATE, Gardener, Rolleston Hall, Burton on Trent.

**ORCHARD TREES.**—It is only too evident in many places that these seldom get the necessary attention paid to them in the way of pruning and training, although a great amount of labour is bestowed yearly on trained trees of small dimensions, from which not more than a bushel of fruit each is obtained. The fruit from the smaller trees is of superior quality to those from the orchard; still, it is to these trees we look for the bulk of fruit for general purposes. In many old orchards there are some trees of no use whatever, the fruit being small and worthless. Grab all such up, and well-trush the ground a couple of spits deep adding plenty of old mortar-balls and road-grit if the land is stiff, and clay marl where it is of a light nature, mixing these and the staple well together, and taking care to remove all roots belonging to the old trees. Strong healthy young trees may then be planted in their stead. Early healthy trees of good standard varieties, such as Blenheim and Ribston Pippins,

Lord Derby, Beauty of Kent, and others, may be greatly improved if all dead wood be cut away, and the heads well thinned by cutting out all cross branches, so that plenty of light and air may have easy access to all parts of the tree. The sun's rays will then be able to penetrate through the branches to the soil. If the trees are infested with moss or lichen, it should be removed from the stem and main branches by scraping the bark with a kind of hoe made for that purpose, or with a piece of hoop-iron, brushing it afterwards with a stiff brush. The trees should then be dusted with some fresh quick-lime, if possible, on a still day, when the branches are wet; or the trees may be sprayed over with a solution of potash and soda, made by dissolving half a pound each of commercial potash and caustic soda in 5 gallons of water, and using it at the temperature of 120°. The hands of the operator must be protected by gloves. If the latter method is carefully done, it will destroy all insects, as well as the moss and lichen. A thin layer of turf from about 8 to 10 feet round the stem, according to the size of the tree, should be taken off, and a dressing of fresh lime given at the rate of 1 lb. per square yard, pointing it lightly into the soil. Afterwards give a good mulching of half-decayed farmyard manure, and replace the turf. Copious applications of manure-water, from the manure-heap or from the cesspool attached to the stables, and slightly diluted with water, will greatly assist old orchard-trees, if given during the winter when the ground is not frozen.

**FILBERTS AND COB NUTS.**—If suckers were allowed to grow on these during the past season, they must be now removed. The best way to do so is to take the soil away down to the roots, and cut the suckers clean away. Replace a portion of the soil, and give a good dressing of manure, covering it with the remainder of the soil. Strong growths that may be required for extension, or to take the place of a worn-out branch, should be shortened to about a third of their length, and all such growths not required should be cut back to two or three buds. Further pruning that may be necessary is best left until the female buds are distinguishable.

### THE KITCHEN GARDEN.

By C. HERRIN, Gardener, Drogheda, Maidenhead.

**FERMENTING MATERIALS.**—Collect leaves in quantity and use them in the preparation, either alone or mixed with strawy manure from the stables, of hotbeds in pits, frames, vineries, &c.

**GENERAL REMARKS.**—If the weather keeps mild, great care should be taken in the storage of seed Potatoes. Dispose them as thinly as possible to prevent untimely sprouting. Digging and trenching should be pushed forward as much as possible when the state of the soil admits. It is desirable in soils of a light nature that trenching be completed early, to allow of the earth settling before the time arrives for the sowing of the various crops. A special effort should be made to trench and thoroughly manure the quarters to be devoted to Onion and Pea-crops, working in a good quantity of manure in the first and second spits of soil. Cauliflower-plants in frames should have thorough ventilation, and lights kept off entirely during mild weather. The same remarks apply to Lettuce and Endive. The latter has kept quite good in the open quarters up to the present time without any protection whatever.

**ORDERING SEEDS.**—It often happens at this season, that with a spell of frost, there comes some amount of leisure time for the gardener and when he can read the seed lists sent him, and select the seeds he will purchase for the current year. Up to the time of writing, however, the weather has kept open, and outdoor operations in the kitchen garden have not been hindered, the prevailing mildness being exceptional. As the seeds of some kinds of vegetables will be shortly required for sowing, the order to the nurseryman or seedman should soon be despatched, early orders, as a rule, ensuring prompt attention, whilst those which arrive late, if large quantities of seed are required, may have to wait all the while the ground is in condition, and the delay to receive the seeds may be prejudicial in several ways to the gardener. Where circumstances permit, I advise a trial of novelties in vegetables, which owing to the improvements that have taken place of late years in raising new, and rigorously employing selection in regard to older varieties,

are not few in number. At the same time, I would advise no one to rely to a large extent on any novelty, to the exclusion of standard varieties, till such time as it has been thoroughly tested in a small way, or a failure in the supply may be the result. As an instance of the use of rigorous selection, very few will, I assume, grow the old form of round summer Spinach, when such excellent varieties as Victoria and Longstanding can now be had which stand without bolting, in summer, a much longer time, possess larger and better leaves, and are good for autumn as for summer sowings. Many desirable varieties of Peas, Onions, Runner, French, and Broad Beans, and Kales have been recently introduced, and at least one novelty of each should, if possible, have a trial.

**SEAKALE ROOTS.**—The greater part of the roots intended for forcing in the Mushroom-house or in pots and boxes, should now be lifted, and the branching rootlets should be removed, and these latter covered with some litter and kept moist, to be made into sets on a wet day. When making these sets, the largest things should be chosen, and those that are less in size than an ordinary cedar-pencil rejected. The set should be 6 inches in length, and cut transversely at the upper or larger end, whence the crown will spring, and slanting-wise at the smaller or lower end. When the sets are prepared, place them closely together (not in bundles) in boxes containing some light sandy soil, the tops being just level with the soil. The stock of forcing crowns should also be kept moist and covered, so as to exclude frost. Where this vegetable is still forced with leaves and dung in the beds where grown, and which, although entailing much labour, is certainly productive of very tender Kale, the crowns may be forced readily from this date onward, and a good, regular supply maintained from a small area, unless very severe weather should set in; and even then it is simply a question of stable-dung and leaves, with a covering of bracken or dry litter over all. This sort of Kale culture should be carried out in some out-of-the-way corner of the garden. The roots may be allowed to stand in such beds for three or more years. If they are properly manured and the plants not allowed to flower, kept free from weeds and the land stirred, good produce is obtained either forced or simply blanched when growing naturally by drawing ridges of mould over the crowns before growth has made a beginning.

**PEAS.**—Peas sown in early winter will now be ready for the sticks, which will afford some slight protection to the plants against frost and wind, and further shelter should be afforded by sticking near the rows some small branches or twigs of the Laurel, Yew, and Spruce Fir, or bundles of bracken placed along the rows or tucked-in loosely between the Pea-sticks. The weather, being now suitable, sowing may be made in the open quarters, drawing the drills and leaving them open for an hour or two, and sowing the seeds thicker than is needed later in the season. If mice are troublesome, damp the Peas, and sprinkle them with powdered red lead, shaking them up well in a box, so as to coat them with it. I find that mice will eat Peas which have been previously sprinkled with petroleum. A part of the south border should be reserved for planting out rows of Peas raised in pots or turves in warmth towards the end of the present month, remembering that there is nothing to gain by sowing in this way at an earlier date.

**BEANS.**—A sowing of the Seville Long-pod Broad Bean may now be made in large 60-sized pots one seed in each, placing the pots in a recently-started vinery or Peach-house, to be planted out later on. These will furnish a supply so early, if not earlier than those sown out-of-doors in November.

### FRUITS UNDER GLASS.

By W. POVE, Gardener, Highclere Castle, Newbury.

**PINES TO RIPEN IN MAY AND JUNE.**—To be enabled to cut ripe fruits as early as the month of May, a selection should be made at this date of the most promising-looking plants of the Queen variety, placing them where more heat can be afforded them. Such plants should be growing in pots of a moderate size, with growth well matured with thick collars, and the centre somewhat low and open, or the chances are that they will start into growth instead of flowering. The soil at the roots should have a watering sufficient to thoroughly moisten the whole,

and afterwards the soil must be kept moderately moist, only till the plants show fruit. Should any of them show a tendency to make growth, they must be kept rather dry at the roots, till it can be seen that the fruit is forming. Let the bottom-heat for these plants range from 85° or 90° with an aerial temperature of 70° on mild, to 65° on cold nights. When the temperature rises to 80° by sun-heat, a small quantity of air should be admitted.

**RIPENING FRUIT.**—Fruit now colouring should be kept drier at the root than is advisable at any other season, no water being afforded after colouring has begun. If the soil be too moist during the ripening process, the fruit will be apt to become black at the core, especially if it should have to be kept for any length of time before it is consumed. Any that may have to be held over for a few weeks, should be cut as soon as ripe, and removed to a cool, dry fruit-room where the temperature can be kept at about 45°, or even a few degrees lower, and where they will keep much better than in the Pine-house.

**SUCCESSIONS**—These plants should be kept quiet for a time, a temperature of from 55° to 60° being sufficiently high, affording air in mild weather, and on bright days, and giving no more water at the root than is actually required to keep them healthy. If the plunging material be rather moist, it will be a good reason for affording water but seldom, and with caution, at this season. Where young stock is grown in low houses or pits, coverings for the glass should be made use of at night, it being very beneficial to the plants, besides saving fuel. If not already attended to, see that soil for potting uses is got under cover, so that it may be in fit condition for use at the February pottings. Good fibry loam is the best for Pines.

**TOMATOES FOR EARLY FRUITING.**—Some seeds should be sown at once where early fruit is required, two dozen plants, or thereabouts, being usually sufficient for an early crop. A selection should be made of a dwarf, medium-sized variety, and the seed sown singly in 3 inch pots, using a rich light soil, pressed moderately firm by the hand. The seed-pots if placed in a Cucumber-house with a temperature of 70°, will not need bottom-heat, as good seed quickly germinates without its aid. As soon as the plants are well above the soil, set the pots on a shelf near the glass, so as to keep the plants sturdy, this being an important item in the successful cultivation of the Tomato, when the pots are filled with roots, and before they become pot-bound, shift the pots into 32's, the soil this time consisting of good loam two parts, and half-decayed leaf-soil one part. Stake each plant before potting it, and plant firmly, and continue to keep the plants near the glass.

**THE ORCHID HOUSES.**

By W. H. WHITE, *Barford, Dorling.*

**THE ODONTOGLOSSUM-HOUSE.**—Where many *Odontoglossum crispum* or *Alexandree* are cultivated, scarcely a week passes without finding some of the plants being in bloom. At this season, many of the plants are showing their flower-spikes. Slugs and small snails, which have a great liking for them, must be carefully sought for every night, any failing in this respect will lead to the loss of flower-spikes. If slugs abound, it is a good plan to isolate the more valuable plants by placing them on inverted flower-pots stood in pans kept filled with water; even with this precaution constant watch is necessary, the slugs remaining hidden in the potting materials. The watch that must be kept for slugs takes up a good deal of the grower's time, but the results fully compensate him for the time and trouble taken. Those persons who bought imported plants of *Odontoglossum* last season will be anxious to see their flowers, and to ascertain if the spotted forms are amongst the purchases. A word of caution against allowing the flower-spikes to remain on the plants for a long period of time, or permitting small weakly imported plants to carry many flowers, to the detriment of the plants, by causing loss of substance and strength, and rendering it difficult, with the best kind of treatment, for them to recover and commence to grow. In the case of strong and well-rooted specimens, it is well to cut the spikes after the flowers have been open for a reasonable length of time. The flower-stalks may be stood in water in the cool-house, or used in indoors decoration; they will retain their beauty for several weeks. If the plants are small, remove most of the buds, leaving just one or two to open for the

determination of the variety; and this known, cut the flower-spike forthwith, and afford the plants a short period of rest, afterwards affording them such treatment that they may grow vigorously, and by next season be enabled to throw strong flower-spikes without loss of strength.

**ODONTOGLOSSUM CÆRSTEDI** (see fig. 11), ETC. —Contrasting greatly in point of growth with this large plant is the dwarf *O. Cæstedi*, and we have several well-bloomed tufts of this pretty white species, which form lovely objects in the cool-house at the present time. The same remarks apply also to the *Sophronites grandiflora* now in full bloom. Both species require an almost identical kind of treatment—that is, they should be grown in shallow pans, with but very little material about their roots; during growth to be well supplied with water, which must be gradually reduced in amount when the pseudo-bulbs are fully made up, but not entirely withheld, and the compost kept just moist even when at rest. *O. Cæstedi* succeeds if suspended close to the roof; and *Sophronites* when it is placed with the *Odontoglossum crispum* in a light part upon the stage, and more especially is this kind of treatment the proper one during the summer. *Sophronites violacea*, a species now opening its flowers, does better when suspended in the coolest part of the intermediate-house.

**ODONTOGLOSSUM CORONARIUM** (see fig. 12). —At present plants of *Odontoglossum coronarium* are in flower in this house. It is a

FIG. 12.—ODONTOGLOSSUM CORONARIUM.

species which is seldom to be seen in bloom. The flowers are of fine form, in colour a rich chestnut-brown, bordered with yellow, with a varnished surface, and very attractive. The successful flowering of this beautiful plant has, unfortunately, been attended in some gardeners' hands with difficulty, although at Barford not any has been experienced; and as regards its culture, we find that it thrives in the same temperature as that which suits *Odontoglossums* generally. It is always placed at the warmer part of the house, and where the light is greatest. It is a plant of strong scandent habit, each new growth extending from 4 to 6 inches. Owing to this habit, the plant should be cultivated in a long, narrow Teak-wood basket, with plenty of drainage and a little peat and sphagnum-moss well mixed with small crocks. The proper time for rebasketing *O. coronarium* is soon after it has flowered—that is, when the growth is about to recommence. Keep the plants near to the roof at all times, and afford it plenty of water the whole year round.

**MASDEVALLIAS.**—Such species as *Masdevallia cucullata*, *M. polycticta* with its spider-like flowers, *M. ludibunda*, and *M. striatella*, form pretty objects in the cool-house at this season of the year.

**THE FLOWER GARDEN.**

By HEDLEY WARREN, *Gardener, Aston Clinton, Tring.*

**HERBACEOUS BORDERS.**—Weather permitting, such strong-growing subjects as *Chrysanthemum maximum*, *Pyrethrum uliginosum*, &c., which may, owing to size, require dividing and re-planting may be attended to. The soil, if exhausted, may be dressed heavily with decayed manure, burnt garden-refuse, road grit, &c., slightly burying the dressing with the digging-fork. In making new borders, the ground should be

well manured and trenched previous to planting. Amongst the various subjects selected for furnishing a border, the following should not be omitted:—*Asters* (*Michaelmas Daisy*), in variety; *Brodiaea congesta*, *Centaurea micropetalala* and *C. Ruthenica*, *Cephalaria alpina*, *Chrysanthemum Maurice Pritchard*, *Coreopsis lanceolata* and *C. grandiflora*, *Eryngium maritimum* and *E. O. O. O. O.*, *Gaillardia*, *Harpallium rigidum*, *Helianthus* in variety, *Heuchera sanguinea*, *Inula glandulosa*, *Iris* in variety, *Montbretias* in variety, *Pæonies*, *Palfoxes*, *Pyrethrum* (double and single), *Rudbeckia Newmani*, *Scabiosa caucasica*, *Thalictrum aquilegifolium*, *Tritoma Macowanii*, *Trollius japonicus*, *Anemone japonica*, &c.

**FLOWER BEDS**—In those beds which were filled in the autumn with bulbs and plants, losses are sure to have occurred, and these should be made good with plants from the reserves. The bulbs should be replaced from the stock of those potted up in small numbers of each variety, bedded out and kept plunged in coal-ashes or cocoa-nut fibre out-of-doors. If not already done, turf may be laid down in mild weather, and grass walks and verges renovated and repaired. Walks and lawns at this season present a tidier appearance, and they are improved in condition if occasionally rolled when the surface is not sticky; neatness and order in the vicinity of the flower garden compensating in a certain degree for the lack of flowers. Odd jobs of various kinds may now be pushed forward.

**PROPAGATION.**—Cuttings of bedding plants, such as *Lobelia erinus*, *Iresine*, *Alternanthera*, *Coleus*, *Ageratum*, *Heliotrope*, &c., may now be put in to strike, or rather the plants may be slightly hastened in warmth before this is done. Tubers of any section or variety of *Dahlia*, which will be required in quantity, after slightly covering them with light soil, may be placed in gentle heat for the production of shoots to serve as cuttings, but the bulk of these roots should remain dormant for several weeks longer.

**CANNAS.**—The rhizomes may be looked over, and if necessary, the stock increased by division, potting up the pieces, and placing them in a Peach-house or vinery that is being started; and when the new growths appear, removing the pots to a cooler house, always keeping them near the glass to maintain a sturdy habit.

**FOLIAGE PLANTS.**—The seeds of *Solanum robustum*, *S. marginatum*, &c., *Canna*, *Abutilon*, *Grevillea robusta*, *Phorarium tenax*, *Eucalyptus globalis*, and sub-tropicals generally requiring a long period of growth, prior to planting them out, may now be sown in pots and pans of light sandy loamy soil, in gentle heat, remembering not to cover them more than their own thickness with soil. Palms, *Ficus elastica*, and similar plants that may be required for use as "dot" plants, should now be re-potted or top-dressed as may seem to be required, in order to have them in good condition by the time they are required for planting out.

**TUBEROUS-ROOTED BEGONIAS.**—Seeds may be sown forthwith in heat, or the stock for bedding purposes may be increased by placing last season's tubers in cocoa-nut fibre in a growing temperature, and when growth has commenced by dividing or cutting them up into pieces each with a bud. It is well to sprinkle powdered charcoal over the raw surfaces of divided tubers, and pot up shortly afterwards in a light sandy mixture. Cuttings may also be struck, taking the young growths when of sufficient length. In sowing seeds, use a sandy peaty compost in well-drained pans (not new ones), and do not cover the seed with soil, but after sowing on a perfectly level surface, water it in with the finest rose-can.

**SWEET PEAS.**—A sowing of Sweet Peas may now be made in pots, for planting out on a sheltered border later on. In light warm soils a sowing may be made in the open, and as soon as the seedlings appear above the ground, affording the patches or lines a dressing of soot to deter insects and birds from molesting them.

**SOLITARY PLANTS ON LAWNS.**—Any of these which appear to need assistance may now be top-dressed. Before doing this, the turf round them should be cut and rolled back, and if the soil is at all dry, afford weak liquid-manure in quantity. Apply the dressing of soil, and relay the turf, making all level and neat again by rolling and beating it.

## APPOINTMENTS FOR THE ENSUING WEEK.

## SALES.

MONDAY,	JAN. 20	{ Plants, Palms, Azaleas, &c., at Protheroe & Morris' Rooms.
TUESDAY,	JAN. 21	{ Paeonia, Carnations, Iris, &c., at Protheroe & Morris' Rooms.
WEDNESDAY,	JAN. 22	{ Japanese Lilies, Fruit Trees, Roses, Gladioli, &c., at Protheroe & Morris' Rooms.
THURSDAY,	JAN. 23	{ Begonias, Roses, Gladioli, &c., at Protheroe & Morris' Rooms.
FRIDAY,	JAN. 24	{ Tuberoses, Begonias, Peonies, Dahlias, &c., at Protheroe & Morris' Rooms. Imported Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—37° 8'.

The common white Jasmine, long been cultivated in this country, that all traces of its original introduction seem to be lost. It is a native of Persia, Kashmir, and the Himalayas, but is quite at home in this country, no frost ever seeming to injure it. In books, as in *Nicholson's Dictionary*, the date of its introduction is given as 1548, but upon what authority or under what circumstances we have not yet had the opportunity of ascertaining. We may, however, call attention to the circumstance that in the collection of pictures by the Old Masters now on view at the Royal Academy, is a portrait of Don GARCIA DE MEDICIS, by ANGELO BRONZINO, in which the lad bears in one hand a spray of Lily of the Valley, and a similar one of white Jasmine. Now, according to the biographical dictionaries, ANGELO BRONZINO was born in 1502, and died in 1572, so that we may assume that this is probably one of the oldest, if not the oldest, representations of the Jasmine in existence. The plant is not mentioned in Turner's *Libellus de Re Herbaria*, 1538. GERARDE, at p. 745 of the *Herbal*, writing in 1597, says, "There be found at this day fower sorts of Jasmine, differing as well in the color of the flowers as in greatness of the same," and goes on to mention: "1, the white Gessamine; 2, the great white Gessemine; 3, the yellow Jasmine; and 4, the blew Jasmine."

As to the latter he writes:—"There is likewise another sort that differeth not from the former in any respect but in the color of the flower; for this plant hath flowers of a blew colour, and the others not so, wherein consisteth the difference."

"Gelsimine (continues GERARDE) is fostered in gardens, and is used for arbora, and to cover banquetting houses in gardens; it groweth not wilde in England that I can understande of, though Master LYTE be of another opinion; the white Jasmine is common in most places in Englands, the rest are strangers, and not seen in these parts as yet." GERARDE adds, "Jasmine or Gelsimine is of the number of those plants which hath neede to be supported or propped up, and yet notwithstanding of itself clasped not, or windeth his stalks about such things as stand neer unto it, but only leaneth and lieth upon those things that are prepared to sustaine it, about arbors and banquetting houses in gardens, by which it is held up."

MILLER, in his *Gardeners' Dictionary* says:—"This grows naturally at Malabar [an error], and in several parts of India, yet has been long inured to our climate so as to thrive and flower extremely well, but never produces any fruit in England."

The Jasmine fruits indeed very rarely, even on the continent, but once, if not oftener, we have seen it, and from the specimens then sent, the illustration, fig. 13, was taken.

Winter-flowering Calanthes.

THERE is scarcely any Orchid or other plant whose flowers are more useful at mid-winter than those of the *Calanthe*. No great amount of skill is wanted to produce satisfactory results; no stove plant is more easily cultivated. Till a few years ago, all that gardeners had available were *C. cristata*, which has white flowers with red and yellow eyes, and the pure white variety, which goes under the name of *C. Turneri*, and *C. Veitchii*. It is a rather curious fact, that notwithstanding the great beauty of the last-named variety, the result of cross-fertilisation, no attempt was made for about twenty years to obtain new varieties from seed. The next to be brought out was *C. Sedeni*; and since that variety was raised, some amateur raisers have been fortunate in obtaining many varieties, and these are almost as common now as those of the *Carnation*. It is known that the raising of crosses and hybrids of Orchids is, as a rule, a slow process, requiring much skill and patience. The *Calanthe*, however, is an exception, the capsules ripening in three months from the time ferti-

lized, the long spikes seem to be a mass of snowy-white flowers, but down the throat a blotch of rich ochre-yellow is noticed, and from this blotch radiate faint lines of pale yellow over the broad lip.

*C. William Murray* has the most vigorous growth of any of the set, producing large pseudo-bulbs, and spikes 3 feet in length. The sepals and petals are white, the throat is maroon, shading off to crimson, and the deeply-cleft lip has a wavy appearance. *C. Bryan* is also a striking variety of vigorous constitution, producing tall, arching spikes. The flowers are ivory-white, with a rich maroon-purple blotch. It was remarked of a batch of plants of this variety in flower at St. Albans, that in the mass "they resembled so many snowflakes spotted with blood."

*C. Clive* is very distinct in appearance, not so vigorous in growth as some others; the colour is a soft rosy-carmine, the sepals fading to white at the margin; the basal part of the lip white, changing into deep rose. *C. Arnold* is also of medium growth, the prevailing colour, like that of *Clive*, is rosy-carmine; the throat, and that part of the lip immediately in front of it, is a soft velvety-crimson; the lateral petals are suffused with pink, fading off to white at the margin.

A few short remarks on culture must not be omitted, for the *Calanthe* must not be treated like *Cattleyas* and *Laelias*, merely because it is an Orchid. Peat and sphagnum-moss are not required, but good fibrous loam three parts, dried cow-manure one part, and a small quantity of leaf-mould, with enough coarse white sand to keep the compost porous. The first week in February is a good time to re-pot the plants. The pots used should be clean and well-drained, over the drainage being placed a handful of the fibrous part of the soil, the latter being shaken out of it, and some of the rougher portions of the cow-manure. Afford no water for ten days after re-potting the plants, and water but sparingly until roots appear; and when the plants are in full growth, weak manure-water is a help to them. Let the night temperature be about 65°, with the usual rise by day.

FIG. 13.—FRUITS OF THE COMMON JASMINUM.

ation takes place; the seed germinates in two or three months, and the young plants produce flowers in three years.

We write about *Calanthes* at this season, because gardeners and amateurs possessed of hot-houses ought to cultivate the plants. We have some out spikes before us, arranged in vases with Fern fronds, and some with spathes of *Anthurium*, which will remain in perfection as cut for a period of several weeks. Those who saw the fine display of new *Calanthes* shown by Messrs. SANDER & Co., St. Albans, at one of the Royal Horticultural Society's meetings towards the end of the last year, will remember how much superior they were to the older forms! and they were well cultivated and exhibited to the best advantage. Most of these varieties were raised by NORMAN C. COOKSON, Esq., Oakfield, Wylam-on-Tyne, an amateur who has worked on the genus for many years, not only raising many new and distinct varieties, but some which had been previously raised by other cross-breeders, notably the pure white *C. Veitchii*. Some of the best of those raised by Mr. COOKSON, and exhibited by Mr. SANDER are *C. Cooksoni*, the name by which this splendid white variety is known in Mr. SANDER'S collection. At first

ROYAL HORTICULTURAL SOCIETY.—There is generally a certain amount of grumbling among provincial and other Fellows of the society that the nominations to the Council are mostly made by the existing Council. We may point out that this is a matter which rests with the Fellows themselves, and if they do not exercise their rights, it is necessary some one else should do so. It would be well if the Council would each year remind their constituents of their duty and of the time when they should be executed.

ROYAL HORTICULTURAL SOCIETY'S COMMITTEES, 1896.—The following gentlemen have been elected to serve on the several Committees. SCIENTIFIC.—Sir J. D. Hooker, K.C.S.I., C.B., F.R.S., &c., The Camp, Sunningdale, Chairman. Dyer, W. T. Thistleton, C.M.G., F.R.S., Royal Gardens, Kew; Foster, Prof. M., Sec. R.S., Great Shelford, Cambridge; Masters, Maxwell T., M.D., F.R.S., &c., Mount Avenue, Ealing, W., Vice-chairmen. Rev. Prof. G. Henslow, M.A., F.L.S., Drayton House, Ealing, W., Hon. Sec. Allen, J., Park House, Shepton Mallet; Baker, J. G., F.R.S., Royal Gardens, Kew; Balfour, Prof. I. B., F.R.S., Botanic Gardens, Edinburgh; Bonavia, Dr. E., 5, Harrington Mansions, South Kensington; Barbidge, F. W., M.A., F.L.S., Trinity College Gardens, Dublin; Church, Professor A. H., M.A., F.R.S., Shelsley, Kew Gardens; Clarke, Colonel R. Trevor, Welton Place, Daventry; Darwin, Francis, F.R.S., Wychfield, Huntingdon Road, Cambridge; Dod,

ORCHID-HOUSE, AT THE DUKE OF WESTMINSTER'S, EATON HALL,

H., Ham House Garden, Richmond, S.W.; Saltmarsh, T. J., The Nurseries, Chelmsford; Smith, James, The Gardens, Meutmore, Lighton Buzzard; Veitch, J. H., King's Road, Chelsea; Veitch, P. C. M., The Royal Nurseries, Exeter; Ward, H. W., Longford Castle Gardens, Salisbury; Willard, Jesse, Holly Lodge Gardens, Highgate, N.; Woodward, G., Birham Court, Teeton, Maidstone; Wright, John, 171, Fleet Street; Wythes, G., Syon House Gardens, Brentford.

GLOBAL COMMITTEE.—Marshall, William, Auchincraith, Bexley, Chairman. D'Oubrain, Rev. H. H., Westwell Vicarage, Ashford, Kent; Fraser, John, The Nurseries, South Woodford; Paul, George, The Old Nurseries, Chesham, Vice-chairman. T. Humphreys, R.H.S. Gardens, Chiswick, W., Secretary. Bain, W., The Gardens, Barford Lodge, Dorking; Barr, W., 12, King Street, Covent Garden, W.C.; Beckett, E., Aldenham House Gardens, Eistree; Blick, Chas., The Warren, Hayes Common, Beckenham; Briscoe Ironside, Henry, Cedar Lodge, Burgess Hill, Sussex; Cannell, H., Swanley, Kent; Dean, R., Ranelagh Road, Ealing, W.; Drury, C. T., F.L.S., 25, Windsor Road, Forest Gate; Fitt, J. H., The Frythe Gardens, Welwyn; Fraser, John, Willow Cottage, Kew; Gordon, G., Eidsleygh, Priory Park, Kew; Harbit, H., Kew Road, Rich-

mond, Surrey; Hogg, R. M., 99, St. George's Road, Pimlico, S.W.; Hudson, J., Gunnersbury House, Acton; Jeffries, C., Boston House Gardens, Brentford; Jennings, J., Ascot Gardens, Leighton Buzzard; Jones, H. J., Ryecroft, Hither Green, Lewisham; Laing, J., Forest Hill, S.E.; Low, R. B., Ashridge Gardens, Berkhamsted; McLod, J., Dover House Gardens, Rushampton; May, H. B., Dyson's Lane, Upper Edmonton; Mawley, E., Rosebank, Berkhamsted; Molyneux, E., Swanmore Park Garden, Bishop's Waltham; Nicholson, G., Royal Gardens, Kew; Noble, C., Sunningdale Nursery, Bagshot; Owen, R., Castle Hill, Maidenhead; Pawle, J. D., 12, Stanley Gardens, Willesden Green, N.W.; Pearson, C.E., Chilwell, Nottingham; Perry, Amos, Hardy Plant Farm, Winchmore Hill, N.; Salter, C. J., Woodhatch Gardens, Reigate; Selte-Leonard, H., Hitherbury, Guildford; Stevens, Geo., St. John's Nursery, Putney; Thomas Owen, Royal Gardens, Windsor; Turner, H., Royal Nurseries, Slough; Walker, J., Ham Common, Surrey; Watson, W., Royal Gardens, Kew.

ORCHID COMMITTEE.—Veitch, H. J., F.L.S., Royal Exotic Nursery, Chelsea, S.W., Chairman. Lawrence, Sir Trevor, Bart., M.P., 57, Princess Gate, S.W.; Masters, Maxwell, T., M.D., F.R.S., Mount Avenue, Ealing, W.; Schröter Baron, The Dell, Staines, Vice-chairman. O'Brien, James, West Street, Harrow-on-the-Hill, Hon. Secretary. Ashworth, E., Harefield Hall, Wilmalow, Cheshire; Ballantine, H., The Dell Gardens, Staines; Bogaerde, A. V., The Woodlands, Great Barr, Birmingham; Bond, T. W., Elstead House, Gardens, Godalming; Broomin-White, R., Ardarroch, Garelochhead, N.B.; Broome, Joseph, Sunny Hill, Llandudno; Barberry, H. A., Highbury Gardens, Birmingham; Chapman, H., Cambridge Lodge, Flodden Road, Camberwell; Cobb, W., Broadwater Down, Tabridge Wells; Cookson, Norman C., Oakwood, Wylam-on-Tyne; Crawshaw, D. Barri, Rosefield, Sevenoaks; Fowler, J. Garney, Glebeland, Woodford; Gabriel, J. T., 32, Palaca Road, Sreat-ham Hill; Handley, Rev. E., 19, Royal Crescent, Bath; Hardy, Fred, Tyatesfield, Ashton-on-Mersey; Hill, E., Tring Park Gardens, Tring; Ingram, C., 86, Onslow Gardens, S.W.; Jacob, E. B., Ewell House, Ewell; Jaques, J., Waddeaden Manor Gardens, Aylesbury; Latham, W. B., Botanic Gardens, Edgbaston, Birmingham; Lindsay, R., Botanic Gardens, Edinburgh; Low, E. V., The Nurseries, Clapton, N.E.; Lucas, C. J., Warham Court, Horsham; Mason, Major, The Fire, Warwick; Paed, Thomas, Roupell Park Nurseries, West Norwood; Pilcher, Charles, 81, Ringford Road, Wandsworth, S.W.; Pollett, H. M., Ferside, Bickley, Kent; Protheroe, W. H., 67, Cheapside, E.C.; Sinder, F., St. Alban; Snee, H. J., Wallington, Surrey; Thompson, W., Walton Grange, Stone, Staffs.; Toi, D., Eastwood Park, Thornliebank, N.B.; Wells, M., Braomfield, Sale, near Manchester; White, W. H., Burford Lodge Gardens, Dorking; Williams, H., Victoria Nurseries, Holloway, N.; Winn, C., The Uplands, Solly Hill, near Birmingham.

NARCISSUS COMMITTEE.—Professor M. Foster, Sec. R.S., Shelford, Cambridge, Chairman. Baker, J. G., F.R.S., Royal Herbarium, Kew; Dtd. Rev. C. Wolley, Edge Hall, Malpas, Cheshire; Engleheart, Rev. George H., Appleshaw, Andover; Wilks, Rev. W., Shirley Vicarage, Croydon, Vice-Chairman. Scrase-Dickins, C. R., Coolhurst Park, Horsham, Hon. Secretary. Barr, P., 12, King Street, Covent Garden, W.C.; Bennett-Pugh, John T., 29, Ashley Place, S.W.; Bourne, Rev. S. E., Dunston Vicarage, Lincoln; Burbridge, E. W., M.A., Trinity College Gardens, Dublin; Cammell, G., Brookfield, Hatherage, near Sheffield; Cammell, M., Lockwood House, Billingshurst, Sussex; Cowan, C. W., Valleyfield, Penicuik, Midlothian; De Graaff, S. A., Leyden, Holland; Goldring, W., 52, Gloucester Road, Kew; Jenkins, E. H., Queen's Road, Hampton Hill, S.W.; Kingsmill, A., Esq., The Holt, Harrow Weald, Stanmore; Krelage, J. H., Haarlem, Holland; Leichthia, Max, Baden-Eden; MacMichael,

Rev. C., Walpole Rectory, Wisbech; Marsh, Rev. T. H., Cawston Rectory, Norwich; Milne-Redhead, R., Hilden Clough, Bolton-by-Bowland, Clitheroe; Moore, F. W., Royal Botanic Gardens, Glasnevin, Dublin; Perry, Amos I., Hardy Plant Farm, Winchmore Hill, N.; Vilmorin, Henry L. De, Quai de la Mégisserie, Paris; Walker, James, Ham Common, Surrey; Ware, Walter T., Inglescombe Nurseries, near Bath; Willmott, Miss, Warley Place, Great Warley, Essex.

RULES FOR JUDGING.—One of the most useful tasks which the Royal Horticultural Society has undertaken has been the formulating a code for the benefit of judges and schedule-makers. This code will be published in a few days at the cost of 1s. 1d. We reserve detailed comments till a future issue, merely stating that such a code must necessarily be, to a large extent, arbitrary, and that, although it will not satisfy the requirements of everybody, and may be susceptible of improvement in detail, yet we trust it will be gratefully accepted, and as loyally obeyed, as circumstances permit. The code has been drawn up by a highly-competent body of committee-men, comprising many of our best exhibitors and judges. We trust this committee will not be dissolved, but will meet once or twice a year to discuss proposed improvements and alterations. The terms "kind," "variety," "genus," "tribe," "family," have been, as usual, stumbling-blocks, but some of the difficulty might have been evaded if the terms in question were used in the sense adopted, for convenience sake, by botanists. The muddle on p. 5, for instance, would thus have been avoided, and something would have been done to improve the extraordinary laxity and confused manner in which terms which have a definite signification are treated by gardeners and others, who ought to know better, as synonymous and interchangeable. So long as this is the case, so long must there be confusion. The word "amateur" is a much-debated term. In any case, the members of the horticultural press who have to act as umpires and interpreters of schedules more frequently than the Royal Horticultural Society, will be glad to be relieved of their duties in future, and to refer their questioners to this Code.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The annual meeting of this praiseworthy Institution is being held at 'Simpon's,' in the Strand, during the time these pages are being prepared for press. A general meeting of members, "to consider and adopt partial alterations and additions to the existing rules of the Institution, recommended by the Committee of Management," was held at 2.15 p.m. The fifty-seventh annual general meeting, for the purpose of receiving the report of the committee and the accounts of the Institution for the present year, electing officers for the ensuing year, and other affairs, including the election of fifteen pensioners on the funds, was held at 3 p.m. Some alterations in the rules, set forth in the report published on another page, were proposed and carried. We have neither time nor space at this moment to mention these in detail; suffice it to say, that by the new rules "market growers," as well as nurserymen and gardeners, are eligible for the benefits of the institution, and that a check has been put upon the proceedings of those who subscribe for a few years for a particular purpose, and having achieved that purpose, forthwith discontinue their subscriptions; that twelve gentlemen living more than 50 miles from the Office shall, as country members, form part of the committee; other rules refer to financial matters. The general effect of these new rules should be to strengthen the Institution, especially in the provinces. The report and balance-sheet were adopted unanimously. The committee reported that, "In consequence of S. Chinery, of Boxford, Suffolk, aged 71, gardener, a yearly subscriber of £1 ls. for fifteen years; A. H. Holmer, of Balham, aged 74, gardener, a yearly subscriber of £1 ls. for twenty-five years; W. Plester, of Elenham, aged 72, gardener, a life

member for twenty-four years; M. Bridger, of Finsbury Park, aged 70, gardener, a yearly subscriber of £1 1s. for fifteen years; and Elizabeth Simpson, of Slough, aged 60, whose late husband was a yearly subscriber of £1 1s. for nineteen years, being in distress, and having in every way complied with the regulations, the committee will recommend that these five applicants be placed on the pension list without the trouble or expense of an election in accordance with Rule III, 5." An election then took place for the remaining ten vacancies. There were forty-one applications, including six that now applied for the fourth, eight for the third, fourteen for the second, and thirteen for the first time. The following are the names of those successful, together with the number of votes given for each:—

WILLIAM BISHOP	...	...	4921
JOHN EWING	...	...	3834
GEORGE FLETCHER	...	...	3739
HESLER FALCONER	...	...	3227
HENRY WOOD	...	...	3131
THOMAS BANNISTER	...	...	2946
JOHN PEARCY	...	...	2809
SAMUEL PICKSTONE	...	...	2513
JAMES FIELD	...	...	2489
WILLIAM CROSHIER	...	...	2468

In the evening will be held the usual friendly supper, at which Mr. P. C. M. VEITCH, of Exeter, will preside.

**ROYAL HORTICULTURAL SOCIETY OF ABERDEEN.**—On the completion of the prize schedule by the directors of this Society one night last week, their chairman, Mr. J. MURRAY, of Glenburnie Park, entertained them at supper. A deputation representing the directors of the Society had an interview with Lord Provost MEARNS on Saturday, on the subject of a site for the next show. The site suggested by the directors is the grounds of Gordon's College.

**ROYAL BOTANIC SOCIETY OF LONDON.**—It is proposed to hold a Conference and Show of Daffodils, also exhibition of other spring flowers, at the Gardens, Regent's Park, London, in the month of April next. Public notice of the date of the Conference will be given as soon as it can be ascertained when the Daffodils will be at their best. Particulars of the show and conference can be obtained on application to Mr. J. BRYANT SOWERBY, the secretary.

**FLOWERS FROM SCILLY.**—The Scilly Islands flower season, says the *Daily Western Morning News* of the 10th inst., has already commenced, though as yet only small quantities have been sent from the islands. About 300 boxes were yesterday despatched from Penzance Station, for the London and midland markets. It is expected that much larger consignments will be made in a week or two.

**THE SURVEYORS' INSTITUTION.**—The next ordinary general meeting will be held on Monday, January 20, 1896, when a paper will be read by Col. G. W. RAIKES (Fellow), entitled "The Re-apportionment of Rates and Taxes." The chair to be taken at 8 o'clock.

**CUCKFIELD CHRYSANTHEMUM SOCIETY.**—Owing to lack of financial support, this now defunct society gradually became weaker, and at the last autumn show very few prizes were offered. The receipts of the society enabled it, however, to clear off all its debts, and it was decided to distribute the balance and dissolve the society. The Chrysanthemum show was originated about ten years ago, when, for two years, it was held in the Drill Hall, and the entire proceeds given to the Gardeners' Royal Benevolent Institution, by which the committee became a life subscriber to that body. A Chrysanthemum society was then formed, with its headquarters at the Talbot Hotel, Mr. TUGWELL being the first secretary.

**A YEAR'S IMPORTS OF FRUITS, ETC.**—There is no reader of this journal but is interested to

the subject of fruit and vegetable consumption, and in the importations from abroad. Month by month we give in as simple a style as possible a record of the importations extracted from the returns published by the Board of Trade. The returns are not so full as they might be, but all in good time. The returns for the year 1895 are a wonderful mass of figures, and the accompanying table, which has been made of additional value by affixing a "difference column," will doubtless be found of great interest to even the most general of readers:—

IMPORTS FOR YEARS	1894.	1895.	Difference.
Fruits, raw:—			
Apples ... .. value	1,389,421	980,273	-409,148
Cherries ... .. "	165,899	95,043	-70,855
Plums ... .. "	392,105	163,045	-229,060
Pears ... .. "	411,316	166,706	-244,610
Grapes ... .. "	470,425	485,978	+15,553
Unenumerated ... .. "	553,859	513,370	-40,489
Onions ... .. "	765,040	696,428	-68,612
Potatoes ... .. "	1,030,091	1,173,392	+143,301
Vegetables, raw, unenumerated ... .. value	1,090,370	1,277,058	+186,688

It is certainly high time that the last heavy item in the list was abolished, by the enumeration of all the articles "lumped" in what may term an "etcetera."

**WILLIAMS' MEMORIAL.**—At a meeting of the Williams' Memorial Trustees held on January 2, Dr. MASTERS in the chair, it was decided to offer two Memorial Medals at the Grand Jubilee Celebration of the National Chrysanthemum Society at the Royal Aquarium, Westminster; one Memorial Medal at the exhibition of the Cardiff Horticultural Society; two Memorial Medals to the Royal Horticultural Society to be competed for at the Temple Show, and at the grand Fruit Show to be held at the Crystal Palace in the autumn.

**MEETING OF THE EDINBURGH SEED TRADE.**—The assistants held their first annual dinner in ARCHIBSON'S ROOMS, Queen Street, on Friday, 10th inst., Mr. HARRY ESKINE presiding over a large gathering. All the leading Edinburgh houses were represented.

**THE EMBANKMENT GARDENS.**—"The Gardens during last year have been fully as unsatisfactory as they were when we last called attention to them. The shrubs are crowded, badly grown, and uninteresting; the beds have been ill-kept, and the plants in them often unsuitable, e.g., the Indian Pinks and the Portulacas, which, brilliant enough in bright sunshine, are at all other times dull and colourless. But it is in the borders which encircle the grounds that incapacity is most manifest. Weedy annuals, and others effective only in mass, have been dotted about as "single spies," not "in battalions;" and at a period when "herbaceous" gardening has almost become a craze, we find no recognition of its value—hardly, indeed, any indication of its existence. To particularise somewhat: the various handsome smaller Sunflowers, with which private gardens have been aglow from summer to late autumn, have been represented only by the coarse and ugly double form of one of them—the worst of its race. The tall white "Marguerites," as the shrubby Pyrethrums are called, have been almost entirely absent; the hardy Lilies have been ill represented; of the beautiful Japanese Anemones, pink and white (more especially the latter), which, once planted, increase with almost weed-like rapidity, and are invaluable in spaces such as the Embankment Gardens offer, we could not find a single example. Chrysanthemums, again, which carry us on with varied colour late into November, are almost unknown, the few there are being of the commonest and poorest kinds. It would be easy to multiply examples, but these will suffice to show the need that exists for reform. Even so simple a matter as the renewing, when necessary, of the Ivy which surrounds the borders, is not attended to; there was a large blank patch in

the end border by the National Liberal Club, which was left unfilled for months. If it be urged that the question is one of expense, that objection can readily be answered. It is not a matter of money, but of intelligence. All the plants we have named are exceedingly cheap; the money spent in digging holes in the lawns and sticking in wretched little *Euonymuses*, of which there are already far too many, would suffice to stock the gardens throughout. This preposterous piece of folly, by the way, has lately been carried out also in Kennington Park—where there is some excellent bedding to be seen near the gates facing Kennington Road—with the result that the once restful sweeps of grass now present the appearance of a badly-planted nursery-ground." *Nature Notes*.

**NEW POTATOS AT CHRISTMAS.**—Many of our readers may have had occasion to remark the exceptional mildness of the climate in the Isle of Wight, but possibly fewer are prepared to hear that Potatoes planted in sheltered slopes on the Undercliff in September may be lifted for consumption at Christmas. Nevertheless, this is what has been attempted at Ventnor, and partial success has followed. The District Council Technical Education Committee, with a view to testing the practicability of encouraging the production of new Potatoes at Christmas in the open as an island industry, arranged an exhibition, which took place last week, when prizes were offered for the best produce. Mr. S. HEATON, Horticultural Instructor to the I. W. County Council, acted as judge, and has furnished a report to the Committee, which has been published in the *I. W. County Press*. The report is not a satisfactory one, notwithstanding the exceptionally open weather preceding Christmas. It may, however, be interesting to quote a few of the conclusions arrived at:—

"1. It is obvious from the results of these experiments that in a fairly mild season new Potatoes can be produced in the neighbourhood of Ventnor by protection at night, and the planting of old sets which are well spered, even if planted so late as the middle of September; but for cooking purposes the quality is improved by planting much earlier than this, and not later than July.

"2. The flavour of those I had cooked, which were planted in September, was very poor, whilst those planted in July were much better, and by some people would possibly be appreciated; but for my own part I prefer good old Potatoes at Christmas.

"3. That for the production of new Potatoes at Christmas it is useless to plant new sets which are in a dormant condition, particularly after the month of July.

"4. That the best crops are produced if no manure is added at the time of planting; this should be done some time previously, so as to become soluble, and thus able to meet the demands of the growing crop.

"5. That amateurs and cottagers and others wishing to have a dish of new Potatoes for Christmas Day can do so in a mild season, if they plant early in a sunny situation, and afford not only night protection, but also protection from the north and north-east winds.

"6. That as a commercial industry the prospect is not very bright. (a) The price would be too high, and only within the reach of a few. (b) Most people would prefer the old Potatoes for flavour.

These experiments prove one important thing, even if the Potato crops have not realised expectations, and that is, that the Undercliff is much warmer than most parts of England, and any other part of the island."

From the above quotation it will be seen that new Potatoes may be obtained by the enthusiastic amateur, at Christmas, provided old tubers already making growth are planted in July. We have only to add, that the estimated price at which these Potatoes would pay is five shillings a pound, in order to show what poor prospect there is of the culture ever becoming of economic significance to the Island.

**THE MOVEMENTS IN THE LEAVES OF SPRUCES\***—In this communication the following points were laid before the meeting:—In the flat-leaved Spruce Fir, in which the stomatal leaf-surface is morphologically the upper one, and which forms WILKONIA's section *Omorica* of the genus *Picea*,

\* Read before the Botanical Society of Edinburgh by Mr. A. D. Richardson.

the twisting of the leaves upon their bases on the horizontal shoots, in order to assume the most advantageous position for the performance of leaf-functions, differs from that in flat-leaved Silver and Hemlock Fir, and in the Douglas Fir, in being reversed in direction, and that as a result of this reversion the order of succession in which individual leaves twist upon their bases on the shoots from zero to the maximum of 180° is also reversed—that is to say, instead of being from below upwards, as in Silver and Hemlock Fir, and in the Douglas Fir, it is from above downwards. In these flat-leaved Spruce Fir a leaf springing from the top of a horizontal shoot does not twist upon its base, while that on the opposite (under) side of the shoot twists through 180°, the amount of twisting in the intermediate leaves being equal to their angular divergence from the point of insertion of the leaf in which no twisting takes place. In flat-leaved Silver and Hemlock Fir, and in Douglas Fir, on the other hand, a leaf springing from the under side of a horizontal shoot does not twist upon its base, while that on the opposite (upper) side of the shoot twists through 180°, the amount of twisting in the intermediate leaves being, as in the case of the Spruce Fir, equal to their angular divergence from the point of insertion of the leaf in which no twisting takes place. A "pseud-distichous" arrangement of the leaves on the horizontal shoots therefore never occurs in Spruce Fir.

**PRESENTATION TO MR. WILLIAM COOMBER.**—A meeting of exhibitors, judges, &c., at the exhibitions of the Royal Botanic Society, took place at the Albert Hotel, Victoria Street, S.W., on the 14th inst., among those present being Messrs. H. J. Veitch, G. Paul, J. Laing, H. Williams, H. J. Cutbush, R. Dean, J. O'Brien, H. Appleby, J. Hudson, J. Jaques, Geo. Wythes, G. Reynolds, G. H. Richard, T. W. Sanders, &c. A preliminary statement was made by Mr. Jesse Willard, the convenor of the meeting, to the effect that the council of the Royal Botanic Society had dismissed Mr. Coomber from the post of superintendent of the society's gardens after he had filled that position for a period of twenty years, on the ground that the strained circumstances in which the society finds itself placed, necessitated the cutting down of expenses, and though the council had treated Mr. Coomber with consideration and courtesy, they were unable to give him a pension or to make him a retiring allowance. He thought the circumstances of the case justified him in calling together a few of Mr. Coomber's friends, to take the matter into consideration, and he desired to thank those present for their attendance. It was resolved that a fund be opened for making a suitable presentation to Mr. Coomber, that it should take the form of a purse of money, that those present should form a committee, with power to add to their number; that Mr. J. Willard, The Garden, Holly Lodge, Highgate, be secretary; and Mr. H. J. Veitch, chairman and treasurer; and that a circular be prepared and sent to the Fellows of the Society, and others. The sum of £36 10s. was subscribed in the room, and regarded as a very satisfactory commencement. A hearty vote of thanks was passed to Mr. Willard for convening the meeting, and to Mr. H. J. Veitch for presiding.

**ABERDEEN GARDENERS' AND FRUITERS' ASSEMBLY.**—The gardeners and fruiterers in Aberdeen and district held their annual re-union in the Albert Hall, Aberdeen, in the end of last week. The gathering, as in former years, proved highly successful and enjoyable. This year the customary social meeting was dispensed with, and the proceedings took the form of a ball, with a supper served during the interval. There was a capital turn out, some 300 being present.

**SOCIÉTÉ FRANÇAISE D'HORTICULTURE DE LONDRES.**—On Saturday last, the annual banquet of the above society was held at the Hotel des Vrais Amis, Soho Square, in commemoration of the seventh anniversary of its foundation. Mr. C. HARMAN PAYNE, the energetic secretary of the National Crysanthemum Society, occupied the chair, and

several English representatives of the horticultural world honoured the society with their presence. We may mention Mr. H. J. Cutbush, Mr. P. M. Barr, Mr. B. Wynne, and Mr. G. Tivey, besides eighteen active members of the International Society headed by their President, Mr. Geo. Schneider, the well-known authority on Ferns. On the removal of the cloth, Mr. Geo. Schneider introduced the chairman to the members, proposed the first of numerous toasts. Speeches by Messrs. C. Harman Payne, Geo. Schneider, and H. J. Cutbush followed.

**GRAND YORKSHIRE GALA.**—The annual meeting of the guarantors and life members of the Grand Yorkshire Gala was held at Harker's Hotel, York, on the evening of 10th inst., Ald. Sir JOSEPH TERRY presiding. There was a large attendance. The Chairman said that the council had waited upon the Bootham Asylum authorities, who had granted them the use of the customary field for the gala on the 17th, 18th, and 19th of June next on the usual terms. Sir Joseph moved that the Lord Mayor be elected president of the gala for the ensuing year. Mr. J. W. Craven seconded the motion. Mr. Councillor Lancelot Foster proposed that Ald. Sir Joseph Terry be re-elected chairman of the council, and paid a tribute to the admirable services he has rendered in years past. Mr. Geo. Kirby seconded. Mr. Edward Rooks was re-elected vice-chairman; Mr. Joseph Wilkinson, treasurer; Mr. C. W. Simmons, secretary; and Messrs. Pearson and Taylor, auditors, for the ensuing twelve months. The Floral, Entertainments, and Finance Committees having been appointed, the following grants were made:—Floral, £600; music, £200; fireworks, £130 (an increase of £30); balloons, £60; and amusements, £175.

**THE SYNCHRONISM OF VARIATION.**—One of the most puzzling things about variations is the simultaneous appearance in widely different localities of the same "sport." A little while since we published a figure of a dwarf Sweet Pea, which reached us from America. Now we learn, that at the same time Mr. Eckford had the same dwarf variety in his grounds at Wem, in Shropshire.

**PHOTOGRAPHING THE INVISIBLE.**—For some time past rumours have been current as to the proceedings of a German professor who claims to be able to photograph the bones of the skeleton, even when clothed with the muscles and skin. The same professor has succeeded in the presence of the German Emperor in photographing a coin enclosed within a box. This will appear to some very wonderful and too like magic to be quite "canny." Scientific men, however, will not find the alleged new discovery at all matter for scepticism. They are quite familiar with such things as conductors and non-conductors of electricity, of polarization, refraction and decomposition of light by prisms, diathermancy, and other illustrations of the "invisible powers of nature." The potential applications of the new discovery are great. To medical men especially they may be of the utmost value, whilst who knows but that the phrase, "seeing what is passing through another's mind," may ultimately become less metaphorical than it now is?

**A HYBRID TULIP.**—In the *Bulletin* of the Royal Tuscan Society of Florence for December, 1895, is given a coloured plate of a Tulip said to have originated as a cross between T. Greigii and T. Kaufmanniana. The plate represents a dwarf plant with very broad spotted leaves, and a short scape, bearing a cup-shaped flower, the segments of which are yellow, flushed in the centre and at the base of each segment with red. It was raised by Mr. SPRENGER, of Messrs. DAMMAN'S nursery, near Naples.

PLANT PORTRAITS.

**BOMBAX MACROCARPUM**, K. Sch.; syn.: Pachira macrocarpa, Solms.—A handsome stove shrub or tree, with digitate leaves, and long funnel-shaped flowers, with free, revolute, leathery leaves and numerous projecting pink filaments (Malvaceae). *Gartenflora*, 1422.  
**LILIUM NEPALESE**, Dou. *Revue de l'Horticulture Belge*, January 1.

**NERINE CURVIFOLIA**, *Revue de l'Horticulture Belge*, January 1.  
**PHILODENDON DEYANSAYEANUM**.—The stalks and under-surface of the leaves of this Peruvian Aroid are of a wine-purple colour. It was introduced by the Horticultural Internationals of Brussels, and is figured in the *Illustration Horticole*, t. 48.  
**SARRACENIA FLAVA** and **S. RUBRA**, *Wiener Illustrirte Garten Zeitung*, t. 19.

BOOK NOTICE.

THE ORCHID HYBRIDS. By George Hansen. (Dalau & Co)

PASSING over the preamble and opening chapters, the greater part of which had better not have been written, and the speculative views and inferences, which are relatively of minor importance, the real purpose of the work, which the author has so patiently and carefully compiled, becomes apparent, viz., the enumeration and classification of the species and varieties used in obtaining hybrid Orchids, with an attempt at scientific classification of the progeny. The author has been as successful as anyone dealing with the difficulties of the task could expect to be, the result of his labours being a compilation that will be very serviceable, especially to those who have sufficient acquaintance with the subject to enable them to grasp the somewhat complicated theories evolved, and the deductions which the author has put forth. At the outset the author laments the unavoidable shortcomings of one who is entirely dependent on the records of the raiser, and on the remarks accompanying the plant, when it is recorded or reported for the first time. After the enumeration of the hybrid *Calanthes*, classified according to their reputed percentage (often erroneous, we fear), the author finishes thus:—"The hybrids, Oakwood Seedling, Phœbe, and Bryan, raised by Murray for Cookson, could not be identified by the notes published with them." But it is to be feared that others, about which the evidence appears more conclusive, might have been placed in the same category. Again: '*Calanthe rosea*, v. *concolor*, r. *pallida*, caeta, *nivea*, *Veitchii lactea*, *V. alba*, and *versicolor*, all raised with Lawrence, Dorking, are names attached to seedlings about which no record was kept." In this the gardener appears to have the best of it, for he identifies and arranges some as varieties of *C. x Veitchii*; whereas the compiler of this work does not know where he should place them.

On the next page (p. 85), under the heading '*Cattalæia*,' is a list of synonyms of *Cattleya x Lælia*, in which the varieties of *Lælio-Cattleya x elegans* figure very prominently with their varietal names placed in one row, and the type "elegans" in the other as their synonymy. This is not admissible, for the plants have always been recorded as varieties of *L. C. x elegans*, and at this it had better rest. In the same column, '*Brysiانا*,' also appears as a synonym of "elegans;" but if we mistake not, it is a variety of *L. purpurata*.

When the compiler comes to the lists of the great genera already published in full in the *Gardeners' Chronicle*, he is on safer ground, and those errors which are made there may be mainly found in the classification, and probably in most instances owing to erroneous records, which the writer in his far-away home had no means of checking.

The lists of natural hybrids and their synonyms, and especially in the case of the *Odontoglossums*, are perhaps the most intricate parts of the work; and as in the classification of the *Odontoglossums*, no two persons can or would arrange them in the same manner, the author is at least entitled to his own views on the subject, and the study of his plan will doubtless be of service to others.

The first supplement has already appeared with the main work, and as it is proposed to issue supplements periodically, we recommend those of our readers who are interested in Orchids to procure the first issue and test it for themselves, for to define all its merits or demerits in this brief notice is not possible. The work displays the most unflinching patience on the part of the author, and the assimilation of nearly everything written by

anyone on the subject, renders the work of value to orchidists, if it be but for the purpose of bringing altogether every record, and placing them in a handy way for reference.

## BELGIUM.

### GHENT HORTICULTURAL MEETING.

At the first meeting of this year Orchids were the only flowers staged, and nearly all of them were from the houses of the well-known grower, M. Jules Hye-Leyson. We may mention *Cypripedium* × *Jeanne Voortman* (× *Sallieri* × *Spicerianum*), a remarkably beautiful hybrid, which won a Certificate of Merit, *par acclamation*; the standard resembled that of the latter parent, with a trace of the thick mid-rib of the former; it is fall, carved back gracefully round the edges, and in colour a very distinctive shade of ivory; the sepals and petals are like those of *C. Sallieri*, but of an exceptionally striking and graceful form. *Odontoglossum crispum*, var. *Mary Peeters*, is one of the most charming and remarkable varieties known; the form, the size, the pure white colour, the large, dark spots, all render this plant unusually beautiful. Another variety of the same species, beautiful in form and in its white colouring, received an award, together with a fine specimen of *Odontoglossum* × *Wilckeannum*, var. *albense* with a raceme of thirty flowers of great beauty. A specimen of the beautiful *Cypripedium* × *Albertianum* bore eight fine blooms. In addition to these beautiful Orchids, M. J. Hye showed six new, unnamed, hybrid *Cypripediums*: 1, *C. Spicerianum* × *villosum*, flower very glossy, robust, of remarkable form, the standard with a white ground and green base, veined with purple, with, in the centre, a wide band of ultra deep purple; 2, *C. Sallieri* × *insigne*; 3, *C. Spicerianum* × *villosum*; 4, *C. Chantini* × *Sallieri*, resembling greatly the former parent, the standard is exceptionally fine, with its wide white border and large spots; 5, *C. Spicerianum* × *insigne* Wallacei, a fine hybrid; 6, *C. Spicerianum* × *Boxalli* like the former varieties it recalls other hybrids. M. Jules Hye also showed *Odontoglossum Warscewiczii*, now very rare, a recently introduced specimen; but very few specimens grow into good plants. On the one shown were many blooms.

MM. Edm. Vervaeet et Cie. staged a hybrid *Cypripedium*, C. × *Reté Vervaeet*, raised from *C. Boxalli atratum* and *Chantini*. The standard is remarkably fine, and has a wide white edge, large blood-red spots, and a very delicate powdering of the same shade; it is fine in form. M. Steinmetz staged a fine *Lycaste Skinneri* variety, *Madame Steinmetz*, described by Mr. O'Brien in our issue of February 2, 1895 *Ch. D. B.*

## FLORISTS' FLOWERS.

### THE CARNATION.

At this season of the year the prudent florist takes stock of his plants and arranges beforehand the details of the work to be done during the next three months. I am now preparing the potting-soil for Carnations, of which a large quantity will be need, and as the staple consists of turfy loam, I have to be careful that it is freed from wire-worm before using it, and this, when cartloads have to be looked over, is an expensive and troublesome affair. In order to avoid the time and labour involved in a personal search amongst the loam-fibre, I now make up a large square heap of loam and manure fresh from the stable, and the two ferment sufficiently to evolve a heat that destroys the wire-worm, leather-coated grubs, and other pests. The loam is freshly cut, and in that condition it contains a good deal of grass, and heats gently without the manure, but never sufficiently to destroy the wire-worm. The ammonia arising from fresh stable-litter may also have a destructive action; at any rate, the troublesome pests are found to be dead when the heap is

turned over. It is advisable also to turn over the heap whilst the heat is good, and thus place what was the centre at the outside, and *vice versa*. I find unless this be done, a few grubs escape. Leaf-mould and sand are added in due proportions afterwards. The plants require to have all dead and decaying leaves removed, and those infested with aphid dipped in a painful of soap-suds. The last week in February or early in March is early enough to re-pot the plants, but it may be performed during March and April. I potted some last season, and planted others out as late as the last week in April, which did remarkably well. It is only right to add that autumn-planting always gives the best results. The plants in frames require plenty of air, and unless very severe weather sets in, the lights may be tilted night and day.

Slips of tree or perpetual-flowering Carnations should now be pnt in, and it is better not to put more than one variety in each flower-pot. I find large and small 60's is a desirable size of pot, the slips being inserted pretty closely together, and the pots plunged in slight bottom-heat in a close frame in the forcing-house, or otherwise kept from the air. The small side-slips pulled off with the finger and thumb, form roots more quickly than the central one, which are thicker, and require a much longer time in which to strike.

### THE ANRICULA.

My plants are still furnished with more leaves than is usual in January, the reason being that sharp frost has been rare. A frost of 20° or so about the new year, if of any duration, soon causes the outer leaves to decay. Some growers prefer their plants to be well frozen, whilst others do not; and it does not seem to matter much as both classes of growers are able to boast of securing good results. Frosts of less than 10° or 12° make no difference to them; but the excessive frosts of last year did punish the Anriculas severely, denuding them of leaves to such an extent, that the best trusses of such sorts as George Lightbody, Richard Headley, Silvia, Mrs. Moore, &c. were outside of the leaves altogether, instead of pushing up in the axils thereof. This was so much opposed to their usual habit, that a general weakness and occasional deformity was observable wherever the plants had been so exposed. Of course, when they had been put into a house heated sufficiently to keep the frost out during its greatest intensity, this was not observable.

The seedlings now vegetating in the seed-pans, or those that appeared above-ground during the autumn months, do best if placed on a greenhouse shelf. Frost has the effect of throwing the tiny seedlings out of the ground, as they have but slight root-anchors to hold them there. The plants must be pricked out as soon as they are ready—a dozen in a small 60. The minute thread-like roots are near the surface, and on that account the soil must always be kept in a moderately moist condition. Now is a good time to sow the seed. It should be sown on a level surface, and very slightly covered with finely-sifted soil, so that none is too deeply covered, nor any not sufficiently. *J. Douglas.*

## HOLLAND.

### THE NEW HORTICULTURAL SCHOOL.

With the appointment of Dr. J. T. Cattie as a Director of the new School for Horticulture, the first step has been made towards carrying out the scheme recently approved by the First Chamber of the Netherlands Parliament. The State Horticultural School will be established in connection with the Agricultural School at Wageningen, where all branches of cultural instruction will be united under one general management. Each separate department of agriculture, horticulture, colonial forestry, &c., will have its own director and teachers. Some details about its organisation may be given later.

### PROFESSOR OUDEMANS

celebrated his seventieth birthday on December 7, and received numerous proofs of his pupils' and friends' affection and respect. Professor Oudemans is not only an appreciated scientist, but has always had an eye for horticultural interests, having been connected with various international exhibitions either as a judge, or as a member of the committee. A most elaborate gardening periodical was issued by Professor Oudemans from 1865 to 1867, with numerous coloured plates and descriptions of new and rare plants. We beg to express our congratulations to the Professor on his recent anniversary, and regret to state that he has had to resign his duty, in accordance with the Dutch University Law.

### PHYTOPATHOLOGICAL INSTITUTE AT AMSTERDAM.

Experimental stations for the study of plant diseases exclusively are at present still rather rare. In Holland, the Government yearly allowed the appropriation of a certain sum for experiments in plant diseases at the Wageningen Agricultural School. Dr. Ritzema Bos, the well-known agricultural scientist, who was in charge of these experiments, received so many applications and enquiries about plant diseases from practical agriculturists, that his time became far too limited for any regular correspondence on these subjects. Meanwhile, it happened that Mr. and Mrs. Scholten-Commelin, of Amsterdam, intended to establish a fund for the maintenance of an institute for the general use of students in biology, in memory of their only son who died in his twenty-fifth year, and was a student of botany and zoology. Mr. Scholten approved of the foundation of a phytopathological school, suggested by Professor Hugo de Vries, of the Amsterdam University; and Dr. Ritzema Bos was appointed Director. The latter became also an extraordinary Professor at the Amsterdam University, and delivered his introductory lecture in December; the school, which already contains a splendid collection of specimens and instruments relating to plant diseases and injurious insects, was opened at the same time. Both scientists and practical nurserymen must render their best thanks to the generous founders of this most important establishment, which will be known as the Phytopathological Laboratorium Willy Commelin Scholten.

### NEW PERIODICALS AND BOOKS.

The number of gardening periodicals in Holland is much more extensive than an outsider would imagine. The most attractive paper is the monthly *Tydschrift voor Tuinbouw*, of quite recent date, the first number having appeared in May last. It contains coloured plates and engravings which hitherto have all been original and well executed. The editors are Dr. B. (botany), Mr. Ide (pomology and fruits), Mr. E. Krelage (bulbous plants and perennials), Mr. Piemper van Balen (floral and greenhouse department), and Mr. Springer (trees and shrubs, landscape gardening).

The official paper issued by the Netherlands Royal Horticultural and Botanic Society appears in a new shape. It is conducted by Mr. Kayk, and as a weekly periodical.

Another journal of equal importance is the weekly *Semperiurens*, conducted by Messrs. Witte, of Leyden, and Groenewegen, of Amsterdam. Besides these, there are *Floralia* (Editor, Mr. Piet), and *Flora and Pomona* (Editor, Mr. Kayk); and a special paper is issued for bulb growers (*Weekblad voor Bloembolter-cultuur*), and another for Rose-lovers (*Rosarium*). The bulb-growers are anxious to have good coloured plates of their trade varieties of the different bulbous plants. Some ten years ago, the firm of A. C. van Eeden & Co., which no longer exists, issued a beautiful collection of plates under the general title of *Album van Eeden*, in which the best-known Hyacinths, Tulips, &c., were represented by excellent drawings. The Bulb Cultural Society now intends to supervise the publication of a similar album, which is in preparation, and the first fascicle of which will leave the press in the present month. The plates will be of the same shape as those in the former

album, and descriptions will be added in the Dutch, English, French, and German languages. No plate will be published without the approval of the Council of the Bulb Cultural Society. The subjects of each plate will be chosen by a majority of votes by the members of the Society. The first series will be completed in five years, and twelve plates are to be published yearly.

NEW PLANTS.

A good opportunity for making known novelties raised or introduced in Holland is afforded by the

an offspring of a cross between *B. metallica* and *B. Scharffiana*, of very vigorous growth, and very floriferous—a really first-class plant; *Incarvillea Delavayi*, the highly prized hardy perennial of the Yunnan, and a plant of the future; a variety of the pink *Calla* with conspicuously reddish-violet spathe, a shade exactly like the drawing sent by Mr. Medley Wood to Kew, and distinct from the pink type introduced two years ago. *Sambucus racemosa plumosa* fol. aur. is a fine golden-leaved Elder, raised by Mr. Wegelenburg at Hazerswoude, and is a decidedly meri-

shown *Abies concolor*, *argentea*, *Watteni* and *Picea excelsa fastigiata*.

A cross between *Gloxinia* and *Streptocarpus* attracted much attention at the local Begonia show held at Haarlem, where also could be observed a tuberous Begonia, with yellow-bordered leaves. If the latter proved to be a persistent character of the variety, it would be a valuable border plant of the future. This special Begonia show was a great success, chiefly owing to some private gardeners, who staged collections both of single and double specimens of a very high standard of perfection. *Correspondent.*

HAKEA MULTILINEATA VAR.

Our illustration of this stately shrub (fig. 14) was kindly furnished by Mr. G. H. Adcock, of Geelong, Victoria. The plant is now very rare, but, as it seeds freely, it could soon be propagated were the taste of the day to veer round in favour of these very beautiful but much-neglected plants. The photograph gives no indication of the beauty of the flower, which is carmine in the centre, shading gradually to a pale pink at the tips of the styles. Mr. Adcock recommends that it be grown in calcareous soil, and adds that, like so many Australian plants, it prefers a soil that has been burnt. The plant was at one time called *Hakea grammatophylla*, F. v. M., but is now considered to be a variety of *H. multilineata*, Meisner.

TYNTESFIELD ORCHIDS.

TYNTESFIELD, the residence of Fred. Hardy, Esq., is situated on the flat lands of Cheshire, midway between Sale and Altrincham. All round about there is a wonderful wealth of tree life, the English Elms particularly being notable for size. This tree seems to revel in a dampish bottom, the bark corrugations being pronounced and healthy, many of the trees that margin the roadside girthing 9 feet, and of proportionate altitude. In the paddock adjoining Mr. Hardy's residence are groups of hybrid Rhododendrons and Hollies, which were sadly disfigured during the severe frosts of the two bygone years, but are now made up and recuperated, and form a fine bit of greenery confronting the house. The glass-houses have been increased quite to quadruple extent within the last two years. Mr. Hardy, as is well known, was by far the largest buyer at Pickering Lodge sale, when that renowned collection was brought to the hammer; indeed, the mantle of the father has fallen on the son, and now the Tyntesfield collection is much larger and more valuable than that of Pickering Lodge. No expense seems to have been spared in constructing a class of houses which, while they look well in themselves, seem admirably adapted for the large and varied lot of tropical, subtropical, and temperate Orchids located therein, and moreover to the credit of the owner and his excellent gardener, Mr. Stafford, they are in the pink of good keeping. Among the tens of thousands presentable as one passes along, there is no semblance of disorder, and cleanliness seems to be the standing order throughout.

Entering by a corridor filled with *Odontoglossum crispum*, the first house, 55 by 18 feet, is filled almost entirely with *Cattleyas*. The span roof rises from the eaves to the apex with wide astragals, and clear 21 oz. glass, admitting plenty of light to the plants. The centre stage is about 6 feet wide in two tiers, and the side stages about 3 feet wide, leaving a passage of 3 feet in width right round. The stages are double, as is now generally the case, and water supply is copious, the whole of the centre covered by the stage being occupied by a water tank.

A good water supply in such a house is very necessary, particularly in the summer; and the extra light tells with advantage on such plants, for instance, as *C. Warszewiczii* (or more popularly, *gigas*), in encouraging it to flower. It is not often in this country that *C. gigas* produces six and seven flowers on a spike—indeed, in many collections it is backward to flower at all. It is different on the Continent,

FIG. 14.—HAKEA MULTILINEATA VAR.; FLOWERS CASMINE. (REDUCED.)

monthly meetings of the Floral Committee of the Netherlands Royal Horticultural and Botanic Society. The most regular exhibitors are some of the leading bulb firms, who, owing to their vicinity to Amsterdam, where the meetings are held, can easily stage cut flowers and specimen plants. The greater number of plants gaining certificates, therefore, are bulbous and hardy plants, to which many beautiful additions have been made of late. Among the most interesting novelties shown this year, we may mention the following, viz., Hybrid Begonia, Glory of Aalsmeer,

torious novelty. *Vriesea Saringariana* is one of Mr. Witte's most recent hybrids, named in honour of Professor Suringar of the Leyden Botanic Gardens, and worthy of its name. The matchless white *Tigridia* (alba immaculata) was shown in August. A dozen varieties of Mr. Krelage's Darwin Tulips and broken amateur Tulips received special awards. A great many new Cacti and single Dahlias formed the chief attraction of the autumn meetings, and about fifty varieties received Certificates and Awards. Of new Conifers, there were

owing to stronger sunlight and better ripening season. In this house there are all the species and sub-species that we can think of, *C. Percivalliana*, and following it in numbers, *C. Trianaei* var. *Schroderae*, *C. Mossiae*, *C. Mendeli*, and other white forms, all of which are represented here; then *C. Bowringiana*, a grand thing—grandly done, the pseudo-bulbs being in many instances like stout Malacca canes for length and bulk, and offering such a variety of colour and such a profusion of flowers that beggars all of the popular *C. Skinneri* by comparison. The collection here, too, of *C. labiata* is a very large one, and comprises some of the most beautiful varieties, as we might well expect from the quantities under cultivation. *C. labiata Cookei* is here, as is also a good form of *C. alba*. The tsetse-fly, which evidently came over with *C. labiata*, has made ravages, and nothing short of cutting out the newly-formed pseudo-bulbs through which this pest borer, and burning everything cut, seems to be efficacious. Many hundreds of pseudo-bulbs, we were told, had been sacrificed; and no doubt Mr. Stafford and his staff are still carefully on the watch. *Cattleya aurea* seems to do wonderfully, and there are hundreds of plants in baskets, suspended from the roof. It is a species that wants abundance of light; and were *Dowiana*, which is more difficult to grow, treated in a similar manner, it might get over the tendency of forming pulpy sheaths round its growing pseudo-bulbs.

A house of similar size to that above described is filled with *Cattleyas* and *Laelias*, of which *L. purpurata* is still one of the most distinguished. It is a free grower, and produces here plenty of flowers. The tendency now is not for plants of elephantine size, but rather for quality; and where quality comes up, then the dividing process comes in. It is pleasant to see *Laelia elegans* growing stout, and looking generally well—it is not always so; pity there are so few now of *L. e. Wolstenholmie*. It would be so useful to the cross-breeder; indeed, here there are some seedlings coming up of that crossed with some of the congener *Cattleyas*. *Brassavola Digbyana* and *glauca* do well among the rack, and form fine material for choice crossing. In this house also is a very fine set of *Sobralias*—pity they are so short-lived as flowers, but then, like the fine *Cingalæa Hibiscus*, they come frequently. The pure white one is here, and so is *Veitchii*, *leucantha*, and *xantholeuca*, and the showy *Lucasiana*. *Cymbidium* are strong and fine—indeed, there is little difficulty in growing them; by far the better one is the hybrid of *Veitch's C. eburneo-Lowianum*, an excellent flower, which will always hold front rank.

The adjoining house is a small span called the Seedling-house, in which all plants that have embryos showing on the surface of the pot are taken in and treated with that care which is requisite. Lots of hybrid *Cattleyas* and *Laelias*, and *Brassavolas* show up. In a house of smaller size running parallel to this are the select *Cattleyas*, which cost a lot of money to begin with, and want painstaking care to keep them moving on. There is this advantage in seedlings of all kinds, that given a fair start, there is not much harking back. It is pleasant to see the embryo bulbs, then the secondary, tertiary, and so on, each one bigger than its fellow, until the flower-sheath half presents itself, and then there are hopes and expectations not always realised. The best-looking pseudo-bulb of any given plant does not always bring the best flower; indeed, it is often the converse, although when we are young, and look very wise, and pick out something, as we think, superior, it is a terrible humiliation to find out that it is practically a weed. To enumerate the gems here would be almost a reproduction of Mr. Chapman's catalogue, so we will forbear, only observing that those who go to see them will not come away disappointed.

Out of this division we enter a corridor filled almost entirely with white *Laelias*—anceps predominating. Of course, there are others of the autumnalis and atro-rubens type, and some of those

beautifully-coloured anceps themselves, which are always telling. There is the pure white anceps, then the coloured blotched lip ones, of which *Dawaoni*, *Schroderae*, and *Williamsi* represent the more prominent. Unfortunately, neither of them are very free flowering. The plants here are of considerable size, and are not wanting in vigour.

Entering from this corridor, we come upon the *Cypripedium*-house, which is 70 feet by 10 feet, and there is enough and to spare of all the best sorts. It seems ungracious to remark to those who have struggled in the earlier days of hybridising, that it would be no loss if three-fourths of the seedlings dignified with names disappeared. The Orchid Committee, we know, are careful in their awards of distinction, and it is right that it should be so. No one with a curled dorsal sepal ought to be tolerated in a collection; we have abundance without them. Look at the type, *Cypripedium insigne*! In point of form that is a model flower. Get as great a variety of colour as possible, but insist upon shape. Here among many hundreds we noted *Lathamianum giganteum*, *macrochilum giganteum*, the fine *Harrisii*, the model *Rothschildianum*, a worthy parent; *Winnianum*, the chaste *Wallisei*, *Jas. H. Veitch*, a gain as being *Curtisii* × *Stonei platyneum*; the pretty *bellatum*, and the still *ne plus ultra*, *niveum*.

Passing through the *Oncotoglossum crispum*-house, which is 37 by 10 feet, there are the usual lot of well-grown plants, many of which have taken high positions wherever exhibited. The one named *Harlyanum* in flower was beautifully spotted all over, and the flower of good formation. We liked *Catherinae* best of all the batch when it was in flower. It is making a grand plant. Then there are numbers of *Pescatori*, *Andersonianum*, *Harryanum*, a beautiful yellow *odoratum*, like cloth of gold, with a fine flower-spike, and many others. Passing out we go through another house, 37 by 10 feet, in which there is a miscellaneous assortment of plants, comprising *Dendrobium Jamesianum*, *Lycaste Skinneri* in many varieties, the white one included—a most valuable species in sending up flowers from now onwards. We noted here the rare *Laelia præstans alba*, and some nicely-grown bits of *Vanda cœrulea*.

The last house in this division is the *Paalæropsis*-house, which is also 37 by 10 feet, and it is full of plants of considerable size in unexceptional health. This is the only house in the whole of the divisions that may be said to be closely shaded in summer. Now, while we write, it gets the full light of day, and it is all needed to finish up and give a constitution to these evergreen plants. And yet a gentleman well-known to me, who has lived in Borneo, says that the majority of the larger plants shed their leaves in the season, and burst out fresh on the return of growth. To practice this experiment in our artificial climate would not do, so that we must come and go in our treatment. The great bugbear to the grower is the pulpy spot that overtakes them, occasioned, no doubt, by perpetual greenery. Here the plants were all remarkably vigorous, even *P. grandiflorum*, which, like the Bornean and those from the Philippines, the most difficult to cultivate, barring *Lowii* and some of its tiny companions. The plants are grown on cylindrical rafts of Teak, and the roots clamber over and seek their way in again among the crocks and charcoal in the interior.

The *Dendrobium*-house is 50 by 10 feet, with a span roof a little more acute-angled than the other houses, and filled with all the best species and varieties in quantities. The seedlings suspended from the glass are numerous, and there are many others; while the commoner herd is treated to pot-spaces on the shelving. The best forms of *D. nobile* still keep to the front, notwithstanding many excellent seedlings. What, after all, is better than the select forms of *D. nobile nobiliss?* and what a length of time it lasts in bloom! the plants of *D. nobile giganteum* grown here are wonderfully fine, and the variety *splendideum grandiflorum* is indispensable in all collections. The hybrids are

in large variety, and the show of bloom is always a fine sight.

In some detached houses there are 5000 plants of *O. crispum*, full of vigour; and then there is also a fine lot of *Dendrobium Phalaenopsis*. The whole of the ranges are heated from one centre by three saddle-boilers, working either together or separately, and the fuel used is anthracite coal, which, although a little dearer, is cheaper in the end than ordinary coal, Mr. Stafford declaring that it saves the work of one man in winter. The stoking, when done at 10 o'clock at night, is generally sufficient for the night; and then there is little dust and soot, not so much as to begrime the stoker; and the vapours from the chimney, if noxious at all, are unseen to the eye. I have had no experience with this coal, but if it can be had at reasonable rates where heating on a large scale is done, it must be a boon. *J. A.*

## HOME CORRESPONDENCE.

**AQUILEGIA SKINNERI.**—Having recently been questioned about this plant, I have looked up information respecting it, and find that the accounts of its native place are not consistent. I believe the original authority for the species is *Bot. Mag.*, t. 3919, and though I have not the volume in which that portrait is contained, I think I am right in saying that it is there described by Sir W. Hooker as having been raised at Woburn Abbey from seeds sent home by Mr. Skinner from Guatemala, and as having flowered in the open ground in the summer of 1841. This information is given in Mrs. Loudon's *Ladies' Flower Garden of Ornamental Perennials*, in which there is a good portrait of the plant taken, it is presumed, from the *Botanical Magazine*. I say a good portrait, because twenty years ago, I, two or three times, raised *A. Skinneri* from seed obtained from Mr. W. Thompson, of Ipswich, and the flowers corresponded in every respect with this portrait, being very long in the trunk, vivid scarlet in colour, and edged at the mouth with very bright pea green. I have frequently grown a Columbine called *A. californica hybrida*, which is earlier to raise, more robust, less bright in colour, and often sold in nurseries under the name of *A. Skinneri*. As for the true *A. Skinneri*, it was decidedly "miffy," seldom flowering till the end of July or beginning of August, and in wet seasons often withering up before flowering. As I could seldom make it ornamental, I gave it up. I understood in those days that Mr. Thompson got the seed from the garden of Mr. Nelson, at Aldborough, where the dry winters suited the plant better than the wet climate and soil of Cheshire. I now ask if any correspondent can tell me the more recent history of this plant, as a wild species. I find in the *Genera Plantarum* that *Aquilegia* is limited to five or six species, and is confined to the temperate zone of the northern hemisphere. *Index Kewensis* prints *A. Skinneri* as a true species, giving the habitat Mexico. The *Kew Hand list* gives it as a native of North-western America; therefore, an inquiry for further information is fully justified. *C. Wolley Dod, Elgje Hall, Malpas.* [See "Answers to Correspondents" in this issue. Ed.]

**BUDBS ON THE SEEDLING PLANT.**—Allow me to tell you of a particularly interesting botanical fact which occurred in a garden in Bohemia. Mr. Tofer, of Reichenberg, sowed seeds of *Trochæolum*, which when they grew, became very spindling, and he cut them off, and in consequence of lack of room elsewhere, placed them in a warm glasshouse. To his surprise these decapitated seedlings pushed out two germs. It would thus appear as if *Trochæolum* might be propagated in this irregular manner. I should be glad if you would afford an explanation, and also tell me if the phenomenon is anything more than temporary. I should be glad if you would tell me under what botanical circumstances these two germs appeared. It may be only temporary, and a method of propagation in this manner cannot be accepted. Again, the reserve of albumen could not possibly produce two plants equally vigorous with the first one. In this garden I have frequently observed *Cobæa scandens* forming shoots between the roots and the (cotyledons?). Do you think that these two cases are identical? *Ad. W. Mayer, Perchtoldsdorf.* [The

formation of adventitious buds on the tigellum or "hypocotyl," has frequently been observed in *Linaria*, *Euphorbia*, and other plants. The development of buds in this situation as the result of accident and the removal of the cotyledons, is very interesting, and might as you say, be utilised for purposes of propagation. Our correspondent might readily make the experiment and ascertain whether similar results followed removal of the cotyledons as a general rule, or whether it was only accidental. En.]

**THE FRUIT SUPPLY OF COVENT GARDEN.**—It afforded me, and doubtless many others, much pleasure to read the article by Mr. G. Monro under the above heading on p. 21 of the *Gardeners' Chronicle*, and I think that gentleman deserves great commendation for his public spirit in penning such a lengthy and instructive letter on this very important subject. It will be apparent to everyone that it is useless to plant fruit orchards, and prune and tend the trees, if there is not a good market and fair prices for the produce; and in most experimental attempts in growing fruit for market, the sale of the produce has been the most unsatisfactory factor, railway rates, and salesmen's commissions having generally taken the lion's share of the market value. Mr. Monro is particularly hard on growers in the matter of packing, or the lack of it. A good many gardeners have charge of young orchards planted with choice varieties, such as Ribston Pippin, Cox's Orange Pippin, &c., and we all know how the most of the fruit is packed in the old sieves and half-sieves, with its bony ribs and unprotected top. Will Mr. Monro kindly give us through your columns a description of the best kind of package, and mode of packing, calculated to meet the wants of Covent Garden Market. *R. M., Newbury.*

**THE CERTIFICATES GIVEN BY THE NATIONAL DAHLIA SOCIETY.**—Your correspondent, "J. S. W.," refers to the certificates awarded in London. I quite agree with him that many first-class and other certificates were awarded to worthless objects at the National Dahlia show held at the Crystal Palace last year. Exhibitors were asked in the schedule to show all seedlings as cut, no wiring being allowed; yet certificates were freely awarded all round, and mostly to those with wired stems, and not, therefore, in accordance with the requirements of the schedule, not one certificated Cactus Dahlia flower being moreover, in my opinion, worthy of a first-class; and many were worthless, and will never be grown again. While I am anxious to get anything good in Cactus Dahlia, scarcely one of those would I grow. What is wanted are flowers like Bertha Mawler, Ma'chless, Mayr Haskins, Harmony, Gloriosa, &c. *Jno. Pope, The Ericas, Northfield, Birmingham.*

**PELARGONIUM MR. GORDON.**—On looking over some back numbers of the *Gardeners' Chronicle* recently, I came across an illustration of the above, grown by Mr. Comfort at Knowle Hall, near Birmingham; and I should feel much obliged if he would kindly state in these pages his methods of culture; also the age of the plant figured. I cultivate several plants of Mr. Gordon, but I fail to find it in any nurseryman's catalogue. I should be pleased if some grower would kindly furnish me with six names of the best varieties of Pelargoniums for winter-work. *A Grower.*

**GAME AND TIMBER.**—"Game's" assertions that keepers do not buy eggs for hatching is absurd, in the face of the lucrative market for pheasant-eggs advertised in every sporting paper, and of the fact that the owners of the greatest game-preserves not only buy eggs, but buy birds also; and that pheasant-egg stealing is one of the most lucrative pursuits of the poachers, who dispose of the eggs to dealers, a subject that has often been dwelt on in the sporting papers as one of the evils of the system. "Game's" figures as to the number of birds reared or brought to the gun by hatching, he cannot furnish the ghost of a proof of, and has no doubt been deluded on the subject by someone to whom he has been writing. S.

**DO OUR WILD BIRDS NEED PROTECTION?**—In answer to this question, I append the following advertisements as samples of what appear week after week in various papers all the year round: "Lovely tame robin, 2s. 6d. each; other birds later on; apply Rectory, Yorkshire;" "Hawks—Wanted, hobby falcons; apply Solicitor, Newcastle-on-Tyne;" "Cock skylarks, 2s. 6d. dozen, plenty more

on hand; apply Dealer;" "Haudsome snow buntings, 1s. 6d. pair, apply Yarrow;" "For sale, clean shot sea and shore birds, for stuffing; state wants; apply Scotland, N.B." These few advertisements should be enough to convince the most sceptical, of whom there are many, who believe that the Wild Birds Protection Acts of 1880 and 1891 are far too stringent, and need no further action from the Government. Yet only the other week a deputation waited on Sir Matthew White Ridley to urge the importance of more species of birds being added to the list of birds that come under the above Acts. Some of the birds mentioned by the deputation (owing to the above feeble Acts having no power to prevent the so-called sportsmen from killing rare species of birds during the autumn and winter months), such as the osprey, the hobby, the buzzard, the ruff—are now almost as rare as the great auk, are only seen in glass cases, and are quite unknown to thousands of the rising generation. Many men look back with pride and love to dwell on the thoughts of the happy moments spent bird-nesting, and I for one would not wish to deprive our boys of to-day from being allowed to go bird-nesting; but I would have them to learn at school, the great need of all birds being cared for and protected, and the great amount of good they do in our fields and gardens. Such information, if taught to our youngsters, would be far more effectual than the hand-bills that are posted up by the police every spring with the lists of birds under the so-called Protection Acts. Many rare birds which are driven inland through want of food or stress of weather, if seen, soon fall before the gun of the ruthless sportsman. To hear me out one has only to see natural history notes in all the sporting papers during many months of the year, where the death of many a rare bird is reported as something to eulogise. Again, one has only to look into our poultry and fish shops to see the thousands upon thousands of larks there are annually slaughtered to appease the appetite of the epicure; also the thousands of plovers that share the same fate, with many more that I could mention—all of which birds are of the greatest use to mankind in clearing the land of various insect pests. In these days of advancement, free education, and lectures on various subjects that are of importance to the present and rising generation, no technical knowledge has been so much neglected in our schools as the knowledge of bird and plant life. I say bird and plant life, because both are so closely associated with each other. Apart from their great beauty, all birds, with few exceptions, will ere long cease an Act passed that shall prevent them from being shot or otherwise destroyed. This will be the only means of preventing the beautiful kingfisher from being killed and his feathers sold to make artificial flies to catch the fish that were sent to feed both men and birds. Many other species of birds in this country are killed and sold for artificial fly making. Not twenty miles from where I am writing, kingfishers are destroyed by the score in severe weather, and this gay and beautiful bird will soon be a thing of the past. The species of woodpeckers which can take care of themselves during the breeding time are, owing to their beauty, much sought for and shot, some to be stuffed and put in glass cases, while many are dressed, and go to form the headgear of women. In conclusion, I would say: Foster a love of birds in the home and schools; teach our youngsters the need of them. The youngsters who live in large towns, and who take cheap trips to the country, often take a delight in destroying our birds wholesale. These same lads, if taught beforehand, would protect the birds rather than destroy them. In regard to birds being used as head-gear, I trust that in a short time some lady or ladies will form a school for drawing and painting all kinds of gay-plumaged birds, and with feathers plucked from fowls and game birds, and with the use of powerful dyes, good artificial substitutes could be made which would be a great saving of bird life. As regards the sportsman, nothing but a stronger Act, or Acts, than those which now exist, will give to our lovely birds that freedom so essential to real life. *W. C. Leach.*

**STEAM ROLLERS.**—If your correspondent, "C. W. W.," who wrote in last week's issue of the *Gardeners' Chronicle* on the modification of a steam-roller, will communicate with Mr. W. J. Stephenson-Peach, Askew Hill, Repton, Burton-on-Trent, he will find both a steam-roller and mowing-machine combined, either worked separately, to suit use, at the low cost of 2½d. per hour. When not in use for rolling, it can be used for pumping, or watering lawns, or for any other purpose for which moderate power is required. *Thos. G. H.*

SOCIETIES.

ROYAL HORTICULTURAL.

JANUARY 14.—The first meeting of the committees for the year was held on Tuesday last, in the Drill Hall, James Street, Westminster. There were numerous members of each committee present, and the show was highly satisfactory, no doubt due in some measure to the open weather, which permitted exhibitors to stage many more Orchids than was possible at the similar meeting held in January last year. Primulas occupied a very prominent position and considerable space in the hall on Tuesday, and there were, as usual, a few groups of miscellaneous plants, &c. Considering the advanced date of the season, there was a remarkable show of Apples, the fruits being shown in very fresh condition. There were several awards granted by the Fruit Committee, but this occasion was remarkable as being one when the Floral Committee did not bestow either a First-class Certificate or an Award of Merit.

Floral Committee.

Present: W. Marshall, Esq., Chairman; and Messrs. Jno. Fraser, O. Thomas, Jno. Laing, C. T. Drury, H. B. May, H. Herbst, R. Dean, J. H. Fitt, Geo. Stevens, Jas. Hudson, J. F. McLeod, R. B. Lowe, J. D. Pawle, Chas. Jiffries, H. Selfe-Leonard, Wm. Bain, C. E. Pearson, Rev. H. H. D'Ombrian, Chas. E. Shea, Jas. Walker, Ed. Mawley, H. J. Jones, Ed. Beckett, Chas. Bick, H. Turner, Geo. Paul, and Geo. Gordon.

A very extensive group of Primulas was exhibited by Messrs. H. CANNELL & SONS, Swanley, which occupied the whole of one of the side tables. The most interesting feature of this group was some plants of the variety known as The Lady, with a decided tier above tier character, but the plants were not yet in full flower, being about a foot high instead of two feet or more. A sport from this variety has been named Purple Lady; White Lady has already been used for hybridising purposes, and crossed with good varieties of the ordinary Primulas, has given rise to a new type, which is known as pyramidalis. The second and third crosses were exhibited, and in each case the character of the flowers of White Lady, together with the habit of the inflorescence is observable in the seedlings, though the flowers are larger and have more substance. Possibly this hybridising will assist the grower to obtain a strain with as good flowers as the best of the old ones have, and a fixed habit of throwing the flowers very much higher than formerly.

Primulas, White Perfection, Cannell's Carmine, Cannell's Pink, Purple Fern-leaf, Cannell's White, Swanley Blue, Cannell's Gem, an excellent pink-flowered variety, and others of the old type were praiseworthy, but will be better at a later date, and we think the pots used for the plants were rather larger than necessary (Silver-gilt Banksian Medal).

Mr. JNO. R. BOX, West Wickham and Croydon, staged a collection of Primulas of a very commendable strain. White Perfection, Intensity (deep red), Cannell's Pink, Princess Mary (white), Wickham Surprise, large-flowered white variety, fringed petals, and robust foliage; Wickham Beauty, very pretty pink; The Queen, bluish-pink; King of the Blues, Marchioness of Lorne, bluish-white; Wickham Giant, large red-flowered variety, with good habit, and a few others were included in the group, all of which were well flowered (Silver Flora Medal).

A group of varieties of Decorative Dracaenas, very fresh-looking, and well coloured, was shown by Messrs. JNO. PEED & SONS, Norwood Road Nurseries, London, S.E.; including Norwoodiensis, Jamesii, Lord Worsley, Mrs. Sladin Wallis, Bartelli, Alberti, and Madame Bergman, which are all capital coloured varieties; and there were shown also Madame Heine, a handsome plant, with broad green leaves, having white margins, the well-known Goldiana, D. terminalis alba, and Alexandra, a partially erect-habited variety, with green and white leaves (Silver Banksian Medal).

A few Chrysanthemum plants in flower of the variety Janette Sheehan were exhibited by Mr. H. J. JONES, of the Ryecroft Nurseries, presumably to show its merit as a late flowerer. The blooms had kept well, but were much past their best when exhibited.

Messrs. JNO. LAING & SONS, Forest Hill Nurseries, London, S.E., staged a fine group of miscellaneous stove and greenhouse plants. In addition to some nice Palms, Crotons, Heaths, Cyrtipediums, Primulas, and Solanums, there were a few small but well-flowered plants of the excellent rose coloured Begonia Gloire de Lorraine (Silver Banksian Medal).

Mr. G. McDUGALL, gardener, Ravenna Cottage, Stirling, sent plants of a variety of *Pteris tremula*, called P. t. Ravenna; but no award was made to this, nor another one called P. t. superba. *P. serrulata cristata* McDougalliana was also sent with these.

From the Royal Botanic Gardens, Glasnevin, were blooms of *Hippocrepis alium grandiflorum*, *Erica Mediterranea* alba, and *F. F. intermedium*.

Messrs. JAS. VEITCH & SONS, Royal Exotic Nurseries, Chelsea again exhibited some of their Rhododendrons, Javauco-Jasminiflorum hybrids.

## Orchid Committee.

Present: Harry J. Veitch, Esq., in the Chair; and Messrs. Jas. O'Brien (Secretary), H. Williams, Jas. Douglas, E. Hill, J. Jaques, W. Cobb, E. Ashworth, T. Statter, H. J. Chapman, T. W. Bond, H. Ballantine, Chas. Pilcher, J. Gabriel, W. H. White, Fred. Hardy, H. M. Pollett, R. Brooman-White, T. B. Hayward, F. Sander, C. J. Lucas, and Chas. Winn.

There was a good attendance, and a great number of meritorious exhibits. Sir TREVOR LAWRENCE, Bart., Burford, Dorset (gr., Mr. W. H. White), contributed a pretty group, the centre plant of which was a magnificent specimen of *Lælia Gouldiana* with about twenty-five spikes, which was awarded a Silver Banksian Medal. Also in the group were the rare *Oncidium* × *Wheatleyanum*, a pretty stand of many varieties of *Lælia anceps*, a fine inflorescence of *Odontoglossum coronarium* minutum, the richly coloured *Cypripedium* × *Lawrebel*, a noble plant of *Lycaste plana* *Measuresiana* (Cultural Commendation), *Cypripedium* × *Morganiae* *Burfordiense*, C. × *Lecanum Albertianum*, and other *Cypripediums*; *Masdevallia ludibunda*, M. *striatella*, M. *polysticha*, and M. p. *purpurea*, to each of which a Botanical Certificate was awarded; M. *occulata*, *Oncidium cucullatum*, *Dendrobium æmulum*, &c. A Silver Flora Medal was awarded for the group.

A Silver Flora Medal was also awarded to Messrs. J. VEITCH & SONS, Royal Exotic Nursery, Chelsea, for a very interesting and showy group, in which their pretty pure white *Phaiocalanthe* × *Sedeni albiflora* secured a First-class Certificate; *Selenipedium* × *Schrodærae cnsidulum* (caudatum *Wallisii* ♂, × *Sedeni candidulum* ♀), an Award of Merit; a spotted and a purple form of *Cypripedium Euryleas* (*Boxalli* ♂, *Lecanum* ♀), two very pretty and distinct things, each an Award of Merit; and prominent objects were noted in the yellow C. *isanguine Sanderianum*, C. × *Lathamianum*, C. × *Niobe*, *Epiphronitis* × *Veitchii*, *Epidandrum* × *Endresio-Wallisii*, *Dendrobium* × *eoussum roseum*, the pretty orange-scarlet *D. subclausum*, &c.

Messrs. F. SANDER & Co., St. Albans, staged a very effective group, the chief attraction in which was the new hybrid *Cypripedium* × *Minnie Ames* (*Curtisii* × *concolor*), a very pretty and distinct hybrid, with wax-like yellowish flowers, delicately tinged with soft rose. Other good things were C. × *Said Lloyd* (*Godefroyæ* × *venustum*), C. × *Henri Vander-Stræten* (Mrs. O. Canham × *Lecanum*), both pretty; C. × *A. R. Smith* (*callosum* × *Druryi*), with yellow and purple-brown, highly polished flowers; C. *nitens*, *Sander's* var.; *Phaiocalanthe* × *Araucidius superbum*; *Dendrobium Johnsonia*, *Platyclinis glumacea*, *Lælia anceps alba*, *Bull's* var., and other *Lælias*; *Lycaste Skinneri*, *L. lanipes*, *Odontoglossum Rossii* *album*, O. *asperum*, &c. (Silver Flora Medal).

Mr. Wm. BULL, King's Road, Chelsea, showed five fine plants of *Cattleya Trianaei* *alba*, whose ivory-white flowers made quite a feature in the show, and gained a First-class Certificate; also showed three well-flowered examples of *Cattleya Walkeriana* *nobilior*.

ELIJAH ASHWORTH, Esq., Harefield Hall, Wilmslow, Cheshire (gr., Mr. H. Holbrook), showed a really remarkable collection of cut examples of rare *Cypripediums*, in which all the finest of the season were represented, comprising fifty distinct flowers, including thirty-six hybrids and fourteen species. The group also contained *Lælia* × *Fitchiana*, and its two reputed parents, *L. alba* and *L. anceps Sanderiana*, and the handsome *Cattleya Trianaei* *Bachhausiana*, grown at its best (Silver Banksian Medal).

R. I. MEASURES, Esq., Cambridge Lodge, Camberwell (gr., Mr. H. J. Chapman), showed a neat group, in which the centre plant was a noble specimen of *Vanda Amesiana*, with ten spikes; and with it the unique yellow *Cypripedium venustum* *Measuresianum*, the rich rose-red C. × *Olenus*, C. × *Fascinator*, C. × *Calypso superba*, *Odontoglossum Humeanum*, *Lycaste Skinneri*, *L. S. alba*, and *Oncidium cheiroporum* (Botanical Certificate). A Bronze Banksian Medal was awarded for the group.

Baron Sir H. SCHRODER, The Dell, Egham (gr., Mr. H. Ballantine), showed a fine plant of *Vanda Charlesworthii* with pretty flowers, smaller than those of *V. curvula* (of which it is said to be a natural hybrid); in colour pale lavender, with slightly rose-tinted labellum (Award of Merit).

The Honble. WALTER ROTHSCHILD, Triang Park, Triang (gr., Mr. E. Hill), showed *Lycaste trifoliata*, Lehmann, a species allied to *L. costata* and *L. lanipes*, with ivory-white flowers, having a curiously-fringed labellum (Botanical Certificate).

Messrs. HUGH LOW & Co., Clapton, staged an effective group of Orchids, including a splendid example of *Cymbidium Traceyanum*, and a noble form of *Cypripedium* × *Olenus*, with rich, vinous purple-tinted flower—the best example yet shown. In the group were also *Cypripedium Sanderianum* and other *Cypripediums*; *Cattleyas*, *Odontoglossums*, &c. (Silver Banksian Medal).

Messrs. B. S. WILLIAMS & SON, Upper Holloway, N., had a group of Orchids in which the *Cypripediums* were the chief feature. Among them were C. × *Fitchianum*, C. × *Huybrechtianum*, C. × *nitens superbum*, C. *insigne* *Fostermani*, C. *Hartwegii*, C. × *Sallieri*, and C. × *S. aureum*, C. × *vestilium superbum*, C. × *Lecanum superbum*, C. × *calophyllum*, C. × *Dautierii striatum*, C. × *Ashburtoniae*, O. *Argus*, &c.; and among other genera *Calanthe* × *Bella*, *Odontoglossum nævium* *msjus*, *Lælia anceps Fitchianum*, and *Lycaste costata* (Silver Banksian Medal), were remarked.

SIDNEY COITRAULD, Esq., Bocking Place, Baintree (gr., Mr. A. Wright), sent an interesting group of *Masdevallias*, which secured a Bronze Banksian Medal. Among them were M. *abbreviata* and M. *caloptera*, both of which received Botanical Certificates; M. *velifera*, M. × *Heathii*, M. × *Hincskiana*, M. × *Gairiana*, M. *fulvescens*, M. *hieroglyphica*,

M. *leontoglossa*, M. *picturata*, M. *Wagneri*, and M. *striatella* Mr. Jas. Fitt, gr. to Earl COWPER, Panshanger, Herts, showed an elegant stand of graceful cut spikes of *Calanthe* × *Bella* (Cultural Commendation).

C. B. POWELL, Esq., The Old Hall, Southborough, Tunbridge Wells (gr., Mr. Dupont), showed a very finely-grown plant of *Angraecum sesquipedale*, with fourteen flowers (Cultural Commendation).

THOS. STATTER, Esq., Stand Hall, Whitefield, Manchester (gr., Mr. R. Johnson), staged the large and richly-coloured *Cypripedium* × *Calypso*, Stand Hall variety, with the large white upper sepal heavily coloured with purple over two-thirds of its surface (Award of Merit); C. × *Annuense* (*Ashburtoniae* × *Numa* ×), a very pretty hybrid, with a very irrelevant name; and C. × *Cores*.

C. L. N. INGRAM, Esq., Elstead House, Gudalming (gr., Mr. T. W. Bond), showed *Lælia-Cattleya* × *Cicero* (C. *intermedia* × *L.-C. elegans* *Turneri*), a very pretty hybrid, partaking somewhat of the aspect of *L.-C.* × *Schilleriana*, but very dwarf in habit, and having the front lobe of the lip developed as in *C. intermedia*; the sepals and petals are white, tinged with rose; the lip rich crimson (Award of Merit); *Cattleya Parcivalliana*, Ingram's var. (Award of Merit); and a *Dendrobium* of the *D. Ainsworthii* class.

JOHN BRADSHAW, Esq., The Grange, Southgate (gr., Mr. H. Whiffen), showed *Cattleya Trianaei*, The Admiral, a very fine flower; *Lælia anceps Sanderiana*, L. a. *Whiffeni*, and *Cypripedium nitens*.

A. WARBURTON, Esq., Vine House, Haslingden, sent flower of a *Cypripedium* said to be *Lawreceanum* × *Fairieanum*, but which the committee took to be C. × *Juno* (*callosum* × *Fairieanum*).

W. C. WALKER, Esq., Winchmore Hill (gr., Mr. G. Cragg), sent *Oncidium Cebolletæ*; Messrs. HEATH & SON, Cheltenham, showed varieties of *Cypripedium* × *Lecanum*, and other hybrids.

## Fruit Committee.

Present: Philip Crowley, Esq., in the chair; and Messrs. G. Buayard, Jas. H. Veitch, A. F. Barron, Jas. Cheal, T. J. Saltmarsh, J. Willard, J. Wright, Alex. Dean, Jno. A. Lalag, J. W. Bates, W. Farr, Wm. Pope, G. H. Sage, Geo. Wythes, F. Q. Lane, H. Balderson, G. Reynolds, G. Norman, and W. Wilks.

Mr. OWEN THOMAS, Royal Gardens, Windsor, was recommended an Award of Merit for Apple Royal Late Cooking, very like Bedfordshire Foundling or Lord Derby, especially the former, but the stalk was set in a shallower basin.

A similar award was recommended to dessert Apple Lord Hindlip, shown by Mr. JNO. WATKINS, Pomona Farm, Hereford, who described the fruit as a Worcestershire seedling, in season from December to March, a heavy cropper. It is a conical fruit of good appearance, but higher on one side than the other, and moderate in size, highly coloured on exposed side, and greenish-yellow, with russety spots on the opposite one. Eye set in an angular moderately shallow basin. Stalk, an inch long, deeply set.

C. W. LEA, Esq., Parkfield, Hallow, Worcester (gr., Mr. W. S. Hurlestone), was recommended an Award of Merit for Pear Beurré Perran, a short thick fruit, yellow nearly covered with russet, stem very long, in very shallow basin, eye open, also very shallow. Flavour rich and good for the season, flesh melting.

Messrs. R. VEITCH & SON, Exeter, showed dishes of Apples, Newtown Pippin, Cornish Gilliflower, Winter Warden, Cornish Aromatic, and D'Arcy Spice (Vote of Thanks).

W. ROUPELL, Esq., Harvey Lodge, Ruppell Park, had a dish of Apple Borden Paragon; and Mr. WM. PRIOR, Sawbridgeworth, an Apple called Sir Walter.

Mr. W. FARR, gr. to A. F. PEARS, Esq., Isleworth (Vote of Thanks), fruits of Tomato All-the-Year-Round (Vote of Thanks).

A magnificent collection of Apples, and a few Pears, were exhibited by Messrs. GEO. BUNYARD & CO., Maidstone, including a hundred varieties of kitchen Apples. The quality in regard to size and fresh-looking appearance was exceptional. Some of the most remarkable were Bass P. O., Annie Elizabeth, Tower of Glamis, Calville, Malings, Belle Pontoise, Emperor Alexander (as fresh-looking as in November), Bismarck, Belle Dubois, Lane's Prince Albert, Lord Derby, Hoary Morning, Newton Wonder, Calville Rouge, King of Tomkin's County. Smaller varieties were equally well shown.

A dish of green fruits of Bramley's Seedling, gathered since Christmas, illustrated the exceptional character of the weather last season. Some good dishes of stewing Pears were noted also (Silver-gilt Knightian Medal).

Messrs. J. CHEAL & SONS, Lowfield Nurseries, Crawley, staged about twenty dishes of Apples and Pears, representative of newer or comparatively little known kinds, such as Atalanta, Armored, Wealthy, Bismarck, Sandringham, Emily Childs, Washington, and others. Pears included Marie Quai, Beurré Gendron, Duchesse de Nemours, Chas. Cogné, and Duchesse de Mouchy (Silver Banksian Medal).

From Messrs. JNO. LAING & SONS was shown a collection of Apples and Pears in about thirty dishes, all of the fruits being sound, and very firm (Silver Banksian Medal).

Mr. JNO. WATKINS, Pomona Farm, Hereford, staged a very interesting collection of Apples, being for the most part varieties but little known, and many of them local seedlings. Among a number of these was an excellent-looking dessert kind, intensely coloured (Silver Banksian Medal).

## Report of the Council for 1895-96.

The following is the report of the council for the year 1895-96, which will be presented to the annual general meeting of Fellows, to be held at the Society's offices, 117, Victoria Street, Westminster, on Tuesday, February 11, 1896, at 3 P.M.

The most important work of the Society during the past year, and that which will have the greatest effect on the gardening of the future, is probably the recent publication of the rules and suggestions for judges and schedule makers.

In response to a widely-expressed wish the council in the autumn of 1894 appointed a committee to draw up such a code of rules, and it is not saying too much to affirm that no committee has (of late years, at least) worked harder or devoted more time to the Society's interests. The most hearty thanks of the Society are due to the members of this committee.

Although actual experience and practice may at first call for divers modifications and additions, yet the result of their labour, as now set forth, is one which the fellows of the Society may well regard with satisfaction, and which will, it is hoped, form the foundation of a code by which all judging at shows will be conducted in years not far distant. The code is published at the Society's office, 117, Victoria Street, S.W., post free, 1s. 1d.

The year has also been marked by the retirement of Mr. BARRON from his long tenure of office as Superintendent of the Society's Gardens at Chiswick—a tenure of thirty years as superintendent, and eight years as foreman—reaching from the year 1857 to the present time. During those thirty-eight years Mr. BARRON has devoted his best energies and the most valuable years of his life to the service of the Society, and after due consideration the Council have thought it right to make him a retiring allowance of two-thirds of his salary, and have conferred upon him an Honorary Life Fellowship in the Society.

The Council desire on their own behalf, and that of the Fellows generally, to tender to Mr. BARRON their fullest acknowledgments of his faithful and valuable services during the many years of his work for the Society, accompanied with the hope that he may long enjoy a well-earned retirement.

In round numbers £1,765 has been expended at Chiswick this year on the general work, and repairs and keeping up of the gardens. The receipts from the gardens by sale of surplus produce amount to £337, making the net cost of the gardens £1,398.

Mr. S. T. WRIGHT, hitherto of Glewston Court Gardens, Ross, has been appointed superintendent.

The Council have thought that for the first year at least it would be best for Mr. WRIGHT to have a perfectly free hand at Chiswick, subject to the control of the Council alone. Whilst therefore expressing their best thanks to the members of the late Chiswick Board, they have decided not to propose the re-appointment of that body for the ensuing year.

Certain alterations which they hope to be able to introduce into the system at Chiswick will develop themselves as time goes on. It would not be wise to put forth an ambitious programme until Mr. WRIGHT shall at least have had time to become intimately acquainted with the garden, its capabilities, and its contents. All practical Gardeners will at once perceive the necessity of allowing 1896 to be a year of what it is hoped may prove unpretentious advance and improvement.

Eighteen Fruit and Floral Meetings have been held in the Drill Hall, James Street, Victoria Street, Westminster, besides the more extended Shows at the Temple Gardens on May 21, 22 and 23; at Chiswick Gardens on September 10; and at the Crystal Palace on September 16, 27, 28; and lectures have been delivered at fifteen of the meetings, exclusive of those given at the conferences. The number of awards has been as follows:—On the recommendation of the Floral Committee, 22 First-class Certificates against 71 in 1894, 174 Awards of Merit against 225, and no Botanical Certificates against 3. On the recommendation of the Orchid Committee, 48 First-class Certificates against 65 last year, 95 Awards of Merit against 134, 72 Botanical Certificates against 21. On the recommendation of the Fruit and Vegetable Committee, 8 First-class Certificates against 15, and 44 Awards of Merit against 132 last year.

For the simplification of office arrangements, and for economy in postage expenses, it has been thought well in future to make the Society's year of work begin and end (as far as allowed by the Charter) with the Annual Meeting in February. For this purpose all Fellows' tickets for 1897 will be available for the January meeting of 1897. The committees recently appointed will also continue in office until the same date.

At the request of several amateur growers a Narcissus Committee has been re-established.

The Council have also thought it well to make an attempt to encourage individual research and effort in obtaining new plants either by importation or hybridisation, and to this end are offering the Society's Medals as prizes, particulars of which will be found in the Schedule of Arrangements, 1896.

The Council desire to draw the attention of all fellows of the Society to the more extended use which the Scientific Committee might be to them if they availed themselves more freely of their privileges in submitting instances of disease or of injuries to plants, caused by insects or otherwise. The Scientific Committee is composed of gentlemen qualified to give the best advice on all such subjects, either in respect to the prevention or cure of disease. The Committee is also glad to receive specimens of malformation or other subjects of Horticultural or Botanical interest.

The Council wish to express their thanks to the Director of the Royal Gardens, Kew, for allowing them to consult Mr. MASSEY, F.L.S., on the fungoid diseases, &c., brought before the Scientific Committee, and to that gentleman for his readiness in giving them the advantage of his knowledge and advice.

The Society's Great Show held (by the continued kindness of the Treasurer and Benchers) in the Inner Temple Gardens, was as successful as ever, and it is a matter of satisfaction to the Council to find that this meeting is now universally acknowledged to be the leading Horticultural Exhibition of this country. The best thanks of the Society are due to all who kindly brought their plants for exhibition, or otherwise contributed to the success of this Show.

The Exhibition of Vegetables held in the Society's Gardens at Chiswick on September 10, was hardly of such practical utility as the Council had anticipated. Wonderful specimens of cultivation were shown, but many of the exhibits were distinctly too large for table use, and the number of exhibitors was comparatively small. It is hoped that whenever another Vegetable Show may be held, this meeting may, at least have taught us what to aim at and what to avoid.

The Great Show of British-Grown Fruit, held by the Society at the Crystal Palace on September 26, 27, and 28, was of even greater dimensions and excellence as regards the fruit shown, and was attended by far larger number of visitors than that of last year. It is needless to enter into details, as full particulars will be found in Volume xix. Part 2, of the Journal recently issued.

As an object-lesson in British Fruit cultivation, this annual show stands out unrivalled, and is of national importance. But its continuance year after year is a matter of the gravest concern to the Council, as it involves a large expenditure without hope of any return. Arrangements have been made with the Crystal Palace authorities for the Society to hold a similar show on October 1, 2, and 3, 1896, but these arrangements are absolutely conditional on a sum of £100 being subscribed by April, 1896, to assist with the Prize Fund.

Messrs. H. J. VEITCH, T. FRANCIS RIVERS, GEORGE BUNYARD, OWEN THOMAS, GEO. NORMAN, J. SMITH (of Mentmore), PHILIP CROWLEY, JOHN WRIGHT, and the Rev. W. WILKS have been appointed a Committee to revise the Schedule of Prizes, and a circular letter inviting subscriptions has been issued, but as it is impossible to send it to all, it is hoped that any who are willing to assist in the continuance of this show, will send their subscriptions to the Secretary, 117, Victoria Street, S.W.

The Journal of the Society has been continued so as to enable fellows at a distance to enter more fully into and reap the benefits of the study and work of those actively engaged at head-quarters. Vol. xviii., parts 3 and 4, vol. xviii., and parts 1 and 2 of vol. xix., were issued during the year, and vol. xix., part 3, is now almost ready for issue.

An examination in the principles and practice of Horticulture was held on May 1, concurrently in different parts of the United Kingdom, a centre being established wherever a magistrate, or clergyman, or schoolmaster, or other responsible person accustomed to examinations would consent to superintend one on the Society's behalf, and in accordance with the rules laid down for its conduct. No limit as to the age, position or previous training of the candidates was imposed, and the examination was open to both sexes. 169 candidates presented themselves for examination, and were divided into three classes. Twelve of the candidates gained 200 marks and more out of a possible 300 in the first class; 37 gained between 150 and 200 marks in the second class; 73 gained between 100 and 150 marks in the third class; and 47 having failed to obtain 100 marks, were not classed. The names and addresses of the successful candidates, together with the number of marks assigned to each, will be found in the Society's Journal, vol. xix., part 1, 1895, p. 1.

It is proposed to hold a similar examination on Wednesday, May 6, 1896, and candidates intending to sit for it should apply to the Secretary, 117, Victoria Street, Westminster, during March.

Acting in conjunction with the Liedley Trustees, the Council have devoted considerable attention to the library. All serial publications have been kept up to date, a large number of valuable volumes have been bound, and the following new books, amongst others, added to the library, viz., Sargent's *Forest Flora of Japan*; M. C. Cooke's *Introduction to the Study of Fungi*; Miller's *Figures of Plants*; Edwards' *Exotic and British Flowers*; *Flore de l'Île de la Réunion*; *Flore de l'Algérie*; Miss Amherst's *History of Gardening*, &c.

A sum of £120 has been received for the Catalogue Fund, which was started in 1694, and the MS. for the Catalogue is almost ready for the press.

The hearty thanks of the Society are due to the Chiswick Board, and to all the members of the standing committees—viz., the Scientific, the Fruit and Vegetable, the Floral and Orchid Committees, for the kind and patient attention which they have severally given to their departments.

The best thanks of the Society are also due to all those who, either at home or abroad, have so kindly and liberally presented books to the Library, or plants or seeds to the Gardens. A list of the donors has been prepared, and will be found in the Society's Journal, vol. xix., part 3, 1895.

The Council wish to express, in their own name and in that of all Fellows of the Society, their great indebtedness to all who have so kindly contributed, either by the exhibition of plants, fruits, flowers, or vegetables, or by the reading of papers, to the success of the fortnightly meetings in the Drill Hall.

The Council have the sad duty of recording the death of forty Fellows during the year, and amongst them they regret to find the names of Lord Aberdare, Dowager Duchesse of

Buccleuch, Thomas Baines, Thos. G. Barclay, C. F. Bause Lady Clarke, Jas. Crispin, Robt. Houlgrave, Prof. Huxley, C. T. Lucas, G. D. Owen, Chas. B. Phillimore, Henry D. Pochin, Geo. Tubor, T. R. Watt, John C. Weeks, and John Wills.

The Society has increased by the substantial number of 181 new Fellows.

A scheme for the affiliation of local horticultural societies was put forward in 1890, and seventy-nine local societies have availed themselves of it. The Council express the hope that Fellows will promote the affiliation of local horticultural and cottage garden societies in their own immediate neighbourhood.

**THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.**

The Committee of the Gardeners' Royal Benevolent Institution have great pleasure in presenting their 57th Annual Report to the Subscribers to the Charity, whom they desire to congratulate upon the flourishing condition of the Institution, whose work they feel, is still a great and much-appreciated blessing among those who have been forced by adverse circumstances to solicit a share in its benefits. It is the greatest satisfaction to the Committee to be able to report that the Annual Festival Dinner, held in June last, was one of the most successful on record. They desire to take this opportunity of expressing their deep sense of gratitude to His Grace the Duke of Fife, who so ably presided on this occasion. It is also gratifying to know that his Grace's earnest appeal on behalf of the Institution was met with a very liberal and generous response. The Committee likewise offer their sincere thanks to all who acted as stewards and to all friends who in any way rendered assistance, thereby ensuring the success of the Festival.

In the past year 18 pensioners have died, five of them leaving widows, whose cases having been investigated and found to be deserving, have been placed on the Pension List at £16 per annum in succession to their late husbands under Rule III. 13. After careful consideration the Committee decided to recommend an increase of 15 pensioners to the number now on the books, five of whom having complied with the conditions of Rule III. 5, they ask the subscribers to place on the funds without the trouble and expense of an election. The remaining ten will therefore be elected in the usual way. It is a source of great satisfaction to the Committee to be enabled thus to increase their number of pensioners by two, making a total of 153, but at the same time they feel sorry that they are not able to render assistance to more of the exceptionally long list of applicants whose cases are all deserving of that aid which must perforce be denied them at present.

In their last report the Committee were enabled to announce the formation of an additional Auxiliary at Wolverhampton, they now have the pleasure to state that a new branch has been established at Worcester after a most successful inaugural meeting presided over by the Rt. Hon. Earl Beauchamp, and addressed by the Treasurer of the Institution, and the Secretary. To the organisers of the meeting, to the Honorary Secretary, and to all who worked so zealously in the cause, the Committee would express their hearty thanks.

The Committee desire to thankfully acknowledge the receipt of £237 3s. 5d. being in part the proceeds of the fund raised to perpetuate the memory of the late Mr. Wm. Thomson of Clovenfords. This sum has been invested, and will henceforth be known as the "William Thomson Memorial Fund." The sincere thanks of the Committee are also given to the promoters of the Concerts held at Altrincham, in aid of the funds. They would also cordially thank other friends throughout the Country who have in any way afforded help to the Institution during the past year.

To increase, as they believe, the usefulness of the Institution the Committee have recommended partial alterations and additions to the existing rules, one of which they desire to specially mention, namely: the addition of twelve gentlemen to their body, to be known as "Country Members," and who are resident more than 50 miles from London. They trust that this measure will tend to create a greater and more widely diffused interest in the affairs of the Institution amongst gardeners and horticulturists generally, as different parts of the country will now be directly represented on the Committee of Management. They would also point out that they have recommended that "Market Growers" should be included amongst those who are eligible to participate in the benefit of the Institution.

It is with regret that the Committee have to announce the resignation of their Chairman, Sir Alex. Arbuthnot, K.C.S.I., who, through ill-health, has been compelled to relinquish the position. They are glad, however, to know that he will still retain a warm interest in the Institution, and they trust he will long be spared to do so. The Committee are sincerely pleased to announce that Mr. Harry J. Veitch has been unanimously elected to fill the vacancy.

In conclusion, the Committee would again remind their friends and supporters that for fifty-seven years the Gardeners' Royal Benevolent Institution has dispensed its benefits throughout the United Kingdom, and the heartfelt gratitude of those who have been assisted from its funds show how highly its help is valued. The Committee earnestly desire to help more of the numerous applicants awaiting aid, and they therefore urgently appeal for additional support,

so that the present income may be augmented, and the good work which has been carried on with such signal success for so long a period, and the beneficial effects of which cannot be over-estimated, may be extended and enlarged.

**TRADE NOTICE.**

**HILL NURSERY, HARTLEY ROW, WINCHFELD, HANTS.**

Messrs. J. M. HENRY & SON have taken over the above nursery from Mr. Wm. Williams, and intend to carry it on as heretofore from this date.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

**THE PAST WEEK.**

THE following summary record of the weather throughout the British Islands for the week ending January 11, is furnished from the Meteorological Office:—

"The weather over the kingdom, as a whole, was dry and settled, but much cloud was prevalent, and in the north and east some slight falls of rain or sleet were experienced at times.

"The temperature did not differ much from the mean, except in 'England, S.W.,' and the 'Channel Islands,' where there was a deficit of 3°. The highest of the maxima were recorded during the middle part of the week, when they varied from 53° in 'Scotland, E.,' to 45° over the southern, central, and eastern parts of England. The lowest of the minima occurred, as a rule, during the latter part of the period, and varied from 20° in 'Ireland, N.,' to 25° in 'England, N.E., E., and S.,' and to 33° in the 'Channel Islands.'

"The rainfall was much less than the mean. Over the greater part of the kingdom the fall was extremely slight, while at many of our western stations there was a complete absence of rain.

"The bright sunshine was again very deficient generally, but just exceeded the mean in 'Scotland, N., and E.,' and slightly exceeded it in 'Scotland, W. The percentage of the possible duration ranged from 10 to 17 in Scotland, from 7 to 15 in Ireland, and from 4 to 14 over England.'

MARKETS.

COVENT GARDEN, JANUARY 16.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. ED.]

Cucumbers, per doz. 15 0-18 0	
Onions, Eng. cwt. 5 0-6 0	

POTATOS.

Trade remains very dull, and prices rule low.

NEW POTATOS.

Canary Island supply gradually increases in quantity. Myatt's from 3d. to 5d. per lb.; Magnums, 2d. to 3d. doz.; Malta Kidney (few only), 12s. to 16s. per cwt. J. B. Thomas.

SEEDS.

LONDON: Jan. 15.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report to-day's market bare alike of buyers and business. With regard to Clover and grass seeds, although there is rather more inquiry for same, no great activity in them has yet sprung up, and values all round are consequently without material alteration. Spring Tares attract increasing attention. Fine Rape seed is getting scarce and commands higher prices. There is no change in Mustard. For bird seeds the sale is slow, on former terms. In Liverpool, Canary seed appears to be firmer.

CORN.

Averages.—Official statement of the average prices of British Corn, imperial measure (qr.), for the week ending January 11, and for the corresponding period last year:—1896: Wheat, 25s. 4d.; Barley, 23s. 11d.; Oats, 13s. 9d. 1895: Wheat, 20s. 8d.; Barley, 21s. 3d.; Oats, 13s. 9d.

FRUITS AND VEGETABLES.

SPITALFIELDS, Jan. 14.—Quotations:—Brussels Sprouts, 1s. to 1s. 3d. per half-bushel; Beetroot, 1s. to 1s. 3d. per bushel; Kale, 9d. to 1s. per bushel; Artichokes, 1s. 6d. to 2s. 6d. do.; Leeks, 1s. per dozen; Parsley, 1s. to 1s. 6d. per dozen bunches; Celery, 9s. to 12s. per dozen rounds; bunch Greens, 1s. 3d. to 1s. 9d. per dozen bunches; Savoys, 2s. to 2s. 6d. per tally; Onions, English, 4s. to 4s. 6d. per bag; Turnips, 1s. 6d. to 2s. per cwt., and 30s. to 40s. per ton; Carrots, 22s. to 25s. per ton; Apples, cooking, 3s. to 4s. per bushel; dessert, 4s. to 5s. do.

FARRINGTON: Jan. 16.—Quotations:—Cauliflowers, 1s. 6d. per dozen (best); Celery, 15s. per dozen rounds; Sprouts, 2s. 6d. per bushel, 1s. 6d. per half-bushel; Leeks, 1s. 6d. per dozen; bunch Greens, 1s. 6d. per dozen bunches; Turnips, 2s. do.; Carrots, 2s. 6d. do.; Artichokes, 1s. 6d. per half-bushel; Horseradish, 1s. 1d. per bundle; Turnip-tops, 1s. per bushel; Kale, curly, 1s. per bushel; Rhubarb, 1s. per dozen bundles; Onions, 4s. per bag; Parsley, 2s. per dozen bunches; Apples, Blenheim, 5s. per bushel; Canadian Baldwin, 16s. per barrel; Newtown, 18s. do.; Greenings, 15s. do.; Grapes, English, 1s. 9d. per pound; Chestnuts, best, 8s., per bag, seconds, 5s. 6d. do.

POTATOS.

SPITALFIELDS: Jan. 14.—Quotations:—Drones, 50s. to 60s.; Reading Giants, 40s. to 55s.; Bruces, 35s. to 50s.; Imperators, 50s. to 60s.; Snowdrops, 50s. to 70s.; Main Crop kidneys, 50s. to 65s.; Hebrons, 6's. to 80s. per ton.

FARRINGTON: January 16.—Quotations:—Main Crop, 80s. to 90s.; Saxons, 75s. to 85s.; Sutton's Abundance, 65s. to 75s.; Bruces, 50s. to 60s.; Magnums, 40s. to 50s. per ton.

HAY.

Averages.—The following are the averages of the prices at the metropolitan markets during the past week:—Clover, prime, 80s. to 95s.; inferior, 50s. to 70s.; hay, best, 80s. to 90s.; inferior, 39s. to 65s.; mixture, 70s. to 87s. 6d.; and straw, 22s. to 49s. per load.

A HEDGE AGAINST SCHOOLBOYS: R. E. B. The plant you allude to, viz., *Maclura aurantiaca* (Osage Orange) is not procurable in sufficient quantity in this country. The Sloe, combined with Traveller's Joy, might serve the purpose; and barbed wire, where legal; but so far as our experience goes, the Hedge plant has not been discovered that would keep a boy in or out of a garden.

APPLES, CHERRIES, AND PLUMS: Pomona. Autumn-planted stocks would not be suitable for working scions upon in the spring, they would not be sufficiently established at the root, but would answer capitally for budding, which is equally as good as grafting, in July, August, and September. Stocks to be grafted should have been one year planted at the least.

ARAUCARIA: S. M. M. As a general rule only one whorl of branches is formed each year, but the rule is not absolute.

AQUILEGIA SKINNERI: C. W. D. The only wild specimen in the Kew herbarium is from the Sierra Madre, Mexico, Pringle, n. 1182. There is no specimen from Guatemala.

BETULA LENTA: W. H. M. This variety belongs to the group of Horbeam-leaved Birches, which have lough, pointed leaves, whose middle nerve has numerous parallel branches, which are connected by means of cross veins. The fruit scales towards the top are broad and tripartite. In Germany it is called the "Zuckerbirke," and it has the synonyms *B. nigra* and *carpiifolia*. It is a fast-growing tree, with black-brown bark, which it casts in broad, thick slabs, but mostly in flakes. The twigs when young are very hairy; leaves inclined to be long, pointed, mostly heart-shaped at the base, simply dentate, at the first hairy, later hairless, upper side shining. We do not know of any advantages in planting *B. lenta* over *B. alba*, the common or Silver Birch, excepting that the former will grow as fast and to a greater height (20 to 24 metres) as compared with the latter (16 to 18 metres). In America, sugar is obtained from *B. lenta*, but this is not generally the case in Germany. According to Nees's edition of *Bonpland's Forester*, vol. ii, p. 473, *B. alba*, the common Birch, is the variety chiefly planted in Prussia, Saxony, Wartenburg, and Posen. It is largely planted in Russia, and occurs as a common tree in

Switzerland and in most northern and mid-European countries, and none of the authorities we have dipped into mentions *B. lenta*.

BOOKS: T. S. B. *How to Grow Peaches and Nectarines in Small Gardens* (Hamilton, Adams & Co., London). *The Carnation; its History, Properties, and Management*, by the late E. S. Dodwell, published at the *Gardening World* Office, I. Clement's Inn, Strand, W.C. *The Rose*, by Rev. O. Fisher, published by Bradbury, Agnew & Co., Ltd., 10, Bonnerie Street, Fleet Street, E.C.

CORRECTION.—In last week's contents, for *La Mortala* read *La Mortola*.

DOUBLE WHITE ROCKET: E. W. Propagation by cuttings is best, and the cuttings may be taken off when growth begins in the spring, selecting shoots of rather weak growth, not the large sappy ones, which are apt to be lost by damp. Plant them in sandy soil, under a hand-glass, on a west border. Cuttings of pieces of the stem sometimes make good cuttings. If the floral display is desired, the plants may remain till August, and then be cut up and treated like the spring cuttings, only it will be advisable to place a frame over the hand-lit to protect them from very severe frosts. Division may be done after flowering, and practised with the double and single-flowered varieties of *Heperis matronalis*, performing the operation in showery weather. The pieces must be copiously watered when water is needed. The plant is really a biennial, although plants in favourable soils and situations live longer; and it is always safest to make some cuttings, &c., every year.

FOREIGN FELLOW OF THE ROYAL HORTICULTURAL SOCIETY: J. M. T. Foreign Fellows are eligible if they pay the annual subscription. You should write to the Secretary at the offices of the Society, 117, Victoria Street, Westminster, S.W., who will furnish all particulars of membership, &c.

GAS LIME: J. D. G. and G. C. Heavy dressings of quite fresh gas-lime should be afforded to land which has been roughly dug or trenched, which will not be sown or planted for four or five months. These dressings should not be turned in until they have been exposed to the weather for at the least two months. Quite slight dressings may be afforded land which is under crop, or will be cropped shortly; and heavy dressings may be turned to the bottom when trenching land three spits deep.

HEARTS OF STRAWBERRY PLANTS IN POTS EATEN AWAY: *Strawberries*. The work of the grub of a species of weevil, introduced probably in the soil. No kind of insecticide will clear them out of the soil that would not injure the plants at the same time. Turn out the balls and look for the grubs. Clear lime water might have the effect of bringing them to the surface, when they could be collected.

MIXED POLLEN: E. W. The fertilisation would doubtless be of a mixed character, and the progeny would necessarily be varied likewise.

NAMES OF FRUITS: J. Borlase Tibbits. Pear, Broom Park.—J. J. F. We do not know the Apple you send us. It seems to be a very good one.—W. J. J. B., T. O., Constant Reader, and *Ficus*, next week.

NAMES OF PLANTS: A. B. 1, *Davallia Tyermanni*; 2, *Polypodium aureum*; 3, *Crassula species*; 4, *Yucca aloefolia variegata*; 5, *Dracena rubra*.—J. R. T. *Ornithogalum longibracteata* n.—D. C. H., *Eucalyptus globulus*—No Name. Two shrubs; 1, *Cephalotaxus pedunculata hastigata*; 2, *Ilex crenata*.

ORCHID CULTURE: S. W. We do not think that you would find the management of the plants difficult, if due attention be paid to our caledariar articles each week. You should use soft water—either rain, pond, or river-water. Well-water, or that which contains lime, sulphur, &c., is very inimical to Orchids. The vapour arising from decaying tree leaves packed under the stages is said to do them good, but is not essential to their well-being. The Dandroses during rest should be kept dry and cool, that is, at a temperature not higher than 50°, and whilst growing and flowering they should have water at the root abundantly afforded. All Orchids, except, perhaps, the Cypripede, require to have the rooting material and drainage renewed either wholly or partially every year. Those growing on blocks, rafts, &c., with but little sphagnum-moss about them, may require looking

to more frequently, but there must be no piling on of moss about the rhizomes or harm will be done.

"ORCHID" SEED PODS: *F. A.* Certainly, neither is the seed-pod of an Orchid. No. 1 is the seed vessel of some species of Cassia, or nearly allied genus. No. 2 is probably the seed-pod of some plant allied to Bigonia.

PEACH SHOOTS DEAD IN PLACES: *W. W.* It is due to a mechanical cause, such as you surmise, viz. frost and drip; and it would not have occurred at all, or to the same extent, had the wood been thoroughly matured. We should suppose that the injury would scarcely show itself on the basal parts of the young shoots, which are sure to be better ripened than those portions you sent to us.

PRIMULAS: *J. M. Bicton.* The variety you send is a good one, and the plant has been well grown. The flowers, however, like others, are only comparatively blue.

ROSE GRAFTING: *Pomona.* It is practised at this season on potted stocks of the Dog-rose, seedling or other, high or low. Keep in a close, moderately moist place, not necessarily very light, with a temperature of 58°. Smear the point of union with grafting-wax; and afford light and air when growth begins. They will flower in the late spring, and make nice plants in six months. Your note was mislaid, hence the delay in answering your questions.

SPRAYING APPLES: *Pomona.* Not when the trees are in bloom, but once before and twice afterwards. Paris Green is a safe wash for caterpillars, and when it is used in the early stages, nothing remains on the fruits in the autumn. Be careful how you handle it, for it is a deadly poison. The same may be said of the Bordeaux Mixture, which is used against all kinds of fungus attacking the leaves or the fruit. We should not see so much specky, blemished fruit, if the latter were more frequently used.

STACHYS TUBERIFERA: *W. H.* The method of cultivation is simple. Having a quantity of the tubers in the month of March, draw drills 1 inch deep and 12 inches apart in ordinary garden soil which has been manured and well dug, and plant them at 6 to 8 inches apart; fill in the drills with the back of the rake, making level and firm by passing a light wooden roller over the surface. Beyond keeping the plantation free from weeds, and stirring the surface so long as this can be done without injuring the plants, nothing more is needed. The tubers are fit to use in late autumn, and onwards. There is no need to put them into store, the plant being quite hardy. The name the French give the tubers—*Crosnes*—is much handier than *ourr*, and ought to be adopted by us.

TOMATOS: *S. Yorks.* There is about as much difference between many of the varieties as between Tweedledum and Tweedledee: a matter of little consequence if the purchasers of the so-called novelties had not to pay a high price for the seeds.

COMMUNICATIONS RECEIVED.—*J. B.—N. E. B.—J. B. B.—J. L.—T. H.—Mrs. L.* is thanked for her suggestion, which has often been the subject of consideration.—*J. S.* you are mistaken. He does not write from that county.—*C. de R.—G. W.—S. M. M.—A. J.—M. D.* (with thanks).—*W. W.—G. H.—E. C.—G. H.,* Ealing.—*Ducie.—J. Brothers.—G. Truffant,* Paris.—*W. & N.,* Academy of Natural Science, Philadelphia.—*W. J. Stephenson* Peach.—*A. H.—R. A. R.—T. W.—H. Correvoa.—D. S.—G. B. & Co.*

CONTINUED INCREASE in the CIRCULATION OF THE "GARDENERS' CHRONICLE."

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardener's Chronicle" has, since the reduction in the price of the paper,

Increased to the extent of more than 80 per cent., and that it continues to increase weekly.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

WHOLESALE SEED CATALOGUE.

We have now published our Wholesale Catalogue of VEGETABLE & FLOWER SEEDS

Containing also the best NOVELTIES of the SEASON, all the recent Improved varieties of Sweet Peas (30 in number) arranged in distinct shades of colour, and LIST of over 150 varieties of choice Fern spores. MAY BE HAD ON APPLICATION. Any of our customers not having received one by post will oblige by letting us know, when another shall at once be posted.

WATKINS & SIMPSON, SEED MERCHANTS, EXETER ST., STRAND, LONDON, W.C. Seed and Trial Grounds—Feltham & Twickenham, Middlesex.

NOVELTY FOR 1896.

Pure White, Large-Flowering, Single Chrysanthemum, "EWAN CAMERON."

First class Certificate, National Chrysanthemum Society, 1895. An exceedingly dwarf-growing variety, only about 18 inches, and very bushy; large pure white single flowers, which may be said to completely cover the plant; it is also invaluable for bouquets and other choice floral-work; grown in 5 or 6-inch pots, it makes a very nice table-plant.

Cuttings, 1s. each; Rooted Plants, 2s. Sent free by post. Cash only.

PRESS NOTICE.—Gardener's Chronicle, Nov. 16, 1895:—"Certificate of Merit to E. O. GOBLE, for Ewan Cameron, a pure white, finely-formed single variety, of dwarf growth, and very free, the award being made to it as a highly promising market variety."

E. C. GOBLE, WALCOT NURSERY, RYDE, ISLE OF WIGHT.

FRUIT TREES A SPECIALTY.

STRAWBERRIES.

ROYAL SOVEREIGN.—The best Strawberry grown. Special quotations for large quantities. Also all the best of the New and Old Varieties, including Competitor, Seasation, A 1, Allan's New Ones, &c.

**TO FLORISTS, &c.**—Young Lady desires an engagement in Florist and Fruiterers; capable of taking charge. Suburbs preferred.—B. B., Mr. Burningham, Newtown Nurseries, Henley-on-Thames.

**A GREAT INJUSTICE** is very often done because some self-assertive people imagine it is next to impossible to make an error. Shakespeare must have made an analytical study of the human heart before he uttered those warning words "Man know thyself, then others learn to know." This is a lesson we should all try and perfect ourselves in, and when this has been done we have to face the significant fact that unless we cultivate good health, prosperity and happiness cannot abide with us. HOLLOWAY'S PILLS will aid us to do this. The most eminent medical men agree that for the preservation of good health and cure of disease there is nothing to equal them.

## NOTICE TO ADVERTISERS.

In consequence of the alteration of the hour of going to Press, consequent on the large increase in the circulation, it is imperative that all Copy for Advertisements should be received BY FIRST POST THURSDAY MORNING at the latest.

**BEST SEEDS AND BEST STRAINS** are all important towards success. Primulas in particular; our seven houses, each 100 feet long, are a splendid sight. It should be borne in mind what we offer are all of our own raising, and have been awarded numerous certificates and prizes; we have therefore good reasons in stating—not merely an assertion—that ours are the best, especially with the additional new and novel pyramidalis varieties. The Daily Telegraph says we cultivated them to perfection. Send for a Catalogue.—H. CANNELL AND SONS, Swanley, Kent.

**HEINEMANN'S CELEBRATED SEEDS.**—Send for CATALOGUE, post-free. Seeds, post-free. F. C. HEINEMANN, Seed Grower, Erfurt, Germany.

**LILUM AURATUM.**—Importation just to head in splendid condition; good flowering bulbs, 4s. per dozen; magnificent bulbs, 6s. per dozen, packed free for cash with order.—H. HEADLAND & CO., Old Road, Gravesend.

**SUTTON'S EARLIEST CABBAGE.**—This very distinct Cabbage increases in favour annually. Hearts large, tender, crisp, and of excellent flavour; but the chief merit is that it comes in very quickly. Price of seed, 1s. and 1s. 6d. per packet, post-free.

**SUTTON'S EARLIEST CABBAGE.**—Mr. H. WATERS, Gardener to Mrs. Mogg, says:—"Sutton's Earliest is the quickest Cabbage I ever grew. Sown in March I cut good heads in June."

**SUTTON'S SEEDS, GENUINE ONLY DIRECT FROM SUTTON AND SONS, THE ROYAL SEEDSMEN, READING.**

Demy quarto, printed on fine paper in grey, gilt top. Price, £1 11s. 6d.

**THE ART AND PRACTICE OF LANDSCAPE GARDENING.** By H. E. MILNER, A.M.I.C.E., F.L.S. With Etched Illustrations and Hand-coloured Plans. To be obtained from the Author, 7, Victoria Street, S.W.; or, from the Publishers, SIMPKIN MARSHALL & CO., Ltd.

**DICKSONS' ROYAL CHESTER TOMATO.**—Raised by Mr. Gilman, Ingestre. Awarded First Prizes at Shrewsbury, Wolverhampton, and other important Shows. Per Sealed Packet, 1s. 6d. DICKSONS, Royal Seed Warehouse, CHESTER.

Wednesday Next. A Consignment of LILIES from JAPAN, comprising:— 10,000 LILIAM AURATUM. 200 " MACRANTHUM. 4,900 " SPECIOSUM ALBUM. 4,200 " RUBRUM. 1,300 " MELPOMENE. Also 12,000 AMERICAN PEARL TUBEROSES, in exceptionally fine condition. The crop is exceedingly short this year.

2,150 EXTRA CHOICE EXHIBITION BEGONIAS, Single and Double, to colour, from a well-known English raiser of high repute, 300 Dwarf ROSES, STOVE and GREENHOUSE FERNS, PÆONIES, GLADIOLI, ANEMONES, CARNATIONS, &c.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on WEDNESDAY NEXT, January 29, at 12 o'clock. On view morning of Sale, and Catalogues had.

Friday Next, January 31. SPECIAL SALE OF HARDY PERENNIALS. New Importation of North American Plants, including Hardy Cypridiums, Lilium Humboldtii, Lilium Washingtonianum, &c.; Calochortus, Tigridias, Gladioli, Iris Kæmpferi, in all the best varieties; Iris germanica, finest named kinds, TUBEROUS BEGONIAS, extra fine tubers; all will flower this year. Gold Medal and First Prize Strain. DAHLIAS, Pot-roots, in the most popular sorts, HOLLYHOCKS, double varieties, in all the most distinct colours. NEW CARNATIONS, very fine stuff, the best varieties, including, among others, Lady Wantage, white; Mrs. Chas. Daniels, bluish; Yellow Queen, yellow. PÆONIES, double and single, very fine roots, splendid varieties. PYRETHRUMS, single and double, clear, distinct colours. IVIES, green and variegated; and other Climbers.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT January 31, at 12 o'clock. On view morning of Sale, and Catalogues had.

Wednesday, February 5. HEMEROCALLIS AURANTIACA MAJOR, A Magnificent New Species, ONE OF THE FINEST INTRODUCTIONS OF RECENT YEARS. Large importation of 900 Clumps, just received from Japan. By order of Messrs. Hurling & Sons, the entire shipment of 45 cases being offered.

The Plant is described and figured in the Gardeners' Chronicle, July 20, 1895, where, on p. 62 Professor BAKER states that it is the finest HEMEROCALLIS he has seen. It has also been figured in the Gardeners' Magazine and Journal of Horticulture for August 17 and August 15, 1895, respectively, and is most highly spoken of in every report. It received F.C. Certificates, Royal Hort. Soc., July 9, 1895, and also at the Manchester Royal Horticultural Society, August 24, 1895.

A Coloured Plate will be on view at the time of Sale. Messrs. Hurling & Sons were the first to introduce this valuable plant, receiving a few from Japan two years since, and the figure in the Gardeners' Chronicle was taken from a plant bloomed at their nurseries. It is quite hardy and very vigorous, foliage deep green, flower spikes strong, bearing as many as twelve flowers in succession, 7 to 10 inches across, of a rich orange-yellow, quite distinct. The flowering period lasts from July to the end of August. It is in every way a most valuable acquisition.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on WEDNESDAY, February 5, at Twelve o'clock. On view morning of Sale, and Catalogues had.

PRELIMINARY NOTICE.

10,000 DENDROBIUMS, FROM BURMA AND ASSAM, INCLUDING WARDIANUM AND OTHER BEST KINDS, in magnificent condition, to be SOLD, on FEBRUARY 14, 1896, WITHOUT ANY RESERVE, AT MESSRS. PROTHEROE AND MORRIS', 67 & 68, CHEAPSIDE, LONDON, E.C.

Friday Next, January 31, 1896. GREAT SALE OF ORCHIDS.

By order of Messrs. F. Sander & Co., St. Albans, comprising splendid consignments of CYPRIPEDIUM STONEI, distinct-looking plants, in grand order, obtained from the C. Masterianum district. Great variation is evidenced in the foliage, and varieties are confidently expected. The unique and wonderful C. Stonei platycanum was obtained from an imported batch of plants, and there is no reason why it, O. S. Cannanum, &c., should not again appear.

VANDA CEBULEA, 1000 plants, in the best order, specially collected in the district from which was obtained the huge richly-coloured forms now in the collections of J. Gurney Fowler, Esq., Lord Ardilaun, Lord Rothschild, &c. The floriferous character of these plants is evidenced by the number and length of the old flower-spikes, and their unimpaired vitality is shown by the firm plump leaves.

A CATTLEYA SPECIES, a small batch of distinct-looking plants, somewhat resembling C. choconensis in habit, but gathered in a district far away from the habitat of that species. Collector says they have white sepals and petals, and rosy and crimson labellums.

HABENARIA SUSANNE, 1000 fine imported tubers. The flowers of this delightful Orchid are of a pure snow-white, borne on tall elegant scapes. It is a grand decorative Orchid, of the easiest culture, requires but little room, and is invaluable for cut-flower work. Awarded a First-class Certificate August 28, 1895.

DENDROBIUM DENSIFLORUM, from the Dokela districts, &c., &c. MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, January 31, at half-past 12 o'clock. On view morning of Sale, and Catalogues had.

WEDNESDAY NEXT.

IMPORTANT SALE.

A Choice Selection of Standard, Pyramid, and Dwarf-trained FRUIT TREES, including many of the leading sorts.

1000 Standard, Half-Standard, Dwarf, and Climbing ROSES, of named sorts, including many of the best, from an English nurseryman.

A Collection of Flowering Shrubs and Trees, CURRANT and GOOSEBERRY TREES, SPIRÆA JAPONICA, in quantity, ARUMS, &c.

An Extensive Collection of Carnations, Iris, Home-grown LILIUMS, LILY OF THE VALLEY CROWNS, LILIAM AURATUM from Japan, BEGONIAS, Pearl and South African TUBEROSES.

MR. J. C. STEVENS will SELL the above by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, on WEDNESDAY NEXT, January 29, at half-past 12 o'clock precisely. On view morning of Sale, and Catalogues had.

Thursday Next.

By order of Messrs. W. L. Lewis & Co. ESTABLISHED ORCHIDS.—In grand health and condition, including Cattleya labiata Youngiana, C. Trianei plumosa, Cypridium bellatulum album, C. Constance, C. Davianum, Miltonia vexillaria Cobbiana, M. v. maculosa, Lælia grandis, L. tenebrosa, Odontoglossum Hallii, exhibition specimen, eight flower-spikes; together with other Cattleyas, Odontoglossums, &c., chiefly in flower or bud. Also—

IMPORTED ORCHIDS, in the finest possible order, comprising Odontoglossum Roscii majus, Cattleya citrina magnifica, Epidendrum vitellinum majus, Cattleya Harrisonæ violacea, &c.

MR. J. C. STEVENS will SELL the above by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY NEXT, January 30, at half-past 12 o'clock precisely. On view morning of Sale, and Catalogues had.

**CHRYSANTHEMUMS.**

We have great pleasure in announcing that we have received from H. Briscoe-Ironside, Esq., a stock of his grand new Japanese—

**MRS. BRISCOE-IRONSIDE.**

The name will show the raiser's opinion of this variety, which he considers the best thing he has ever produced; it has been awarded First-class Certificates every time exhibited (unanimous votes each time), and is, without doubt, the most beautiful Jap. yet seen. The colour is most lovely, a delicate transparent flesh tint, and the bloom large without a trace of coarseness. Every grower, whether for exhibition or personal pleasure, should secure at once.

**J. R. PEARSON & SONS,  
CHILWELL NURSERIES, NOTTS.**

**SELECT NOVELTIES IN FLOWER SEEDS for 1896, OFFERED BY HURST & SON, 152, HOUNDSDITCH, LONDON. SEED MERCHANTS.**

OUR COMPLETE LIST OF NOVELTIES WILL BE POSTED IN A FEW DAYS.

**WALLFLOWER RUBY GEM.**

This grand Novelty is certainly the most brilliant and effective variety of single Wallflower hitherto sent out.

The colour is a beautiful clear shade of Ruby-Violet, with a bluish satin-like sheen (quite unlike the old purple Wallflower, which is more dark and dull in colour), and when seen in a mass the effect produced is very striking. It has the habit of the ordinary dark Blood Wallflower of medium height, and the flowers are extra large and of good substance.

A coloured illustration of this Novelty will be issued with our General Seed Catalogue for 1896.

Large Packets, retail, 1s.; Smaller Packets, retail, 8d.

**GRAND NEW CRIMSON**

**PERPETUAL-FLOWERING CARNATION, URIAH PIKE.**

(Grown by Mr. GEORGE MAY, Teddington, from whom we have bought the entire stock of seed grown this year, and now offer the same for the first time.)

Awarded Six First-class Certificates, besides the Silver Gilt and Silver Medals of the R.H.S.

This is undoubtedly the GRANDEST CRIMSON CARNATION ever offered, at the same time the most decided acquisition to the Tree or Perpetual-flowering class that has ever been raised. In point of colour this noble Carnation reigns supreme, being a veritable GLOWING CRIMSON-VELVET SELF, and in this respect ABSOLUTELY UNIQUE.

Packets of 50 Seeds, retail, 2s. 6d. each; Packets of 25 Seeds, retail, 1s. 6d. each.

FOR PRICES TO THE TRADE, SEE OUR NOVELTY LIST.

**SWEET PEA CUPID.**

We call special attention to the new dwarf SWEET PEA CUPID, a most unique Novelty of American origin, for which we have been appointed by the Vendors, MESSRS. ATLEE, BURPEE, AND CO., PHILADELPHIA, Sole Agents for the distribution to the Trade in Great Britain, the Australian Colonies, and India.

A brief Description of Cupid (the only dwarf Sweet Pea ever known).—The foliage is very dark green; blossoms pure waxy-white, of unequalled substance, and fully as large as "Emily Henderson." The plant does not grow over 5 inches high, and never more than 12 to 15 inches in diameter. The stems are about 4 inches long, bearing two or three blossoms, all very near the end of the stem. It is a wonderfully free bloomer, and begins to flower as early as May and continues until November. The seed is white, and of usual size.

Packets of 20 Seeds, retail, 1s. each; Half-size Packets of 10 Seeds, retail, 8d. each

Electros, for use in Catalogue, supplied free on application.

**IMPORTANT NOVELTY OF LAST YEAR.**

**PRIMULA FIMBRIATA RUBRA SUPERBISSIMA.**

This grand new Primula may be described as the red counterpart of P. alba magnifica. The fringing of the extra large bold flowers—which are of great substance—is of the same heavy character as in P. alba magnifica, and which distinguishes that variety from all others; whilst the colour is that of the best type of the ordinary "rubra."

Per Packet, retail, 2s. 6d.; Larger size Packets, retail, 3s. 6d.

**STERLING NOVELTIES for 1896.**

Our own introduction—now offered for the first time.  
Post Free.

**BEAN, DWARF FRENCH, WILLIAMS' EARLIEST OF ALL.**

This new variety is the earliest French Bean in cultivation. It can be forced a good deal earlier than any other variety. It is a splendid variety for pot culture as well as for outdoor work. It grows from 18 to 24 inches high, is a strong vigorous grower with a good constitution; the pods are long, broad, and fleshy, and of a green colour. They are very tender when cooked, and of excellent flavour.  
Per packet, 1s. 6d.

**TOMATO, "WARRIOR."**

This magnificent variety is a very free setter and good cropper, producing its fruits in great clusters. The fruit is large, round, and without ribs. The flesh is of a crimson colour, firm, with flavour of the finest quality. As the fruit is exceedingly symmetrical in shape, it will prove very valuable as an exhibition variety.  
Per packet, 1s. 6d.

**NEW GIANT PRIMULA—PRIMULA SINENSIS FIMBRATA "Magnum Bonum."**

This beautiful variety will form an excellent companion to the Giant White Primula, "Snowball," we sent out last year. We have every confidence in placing it before our Customers. The plants are very sturdy and compact in habit; the flower stem is strong, and rises well above the strong, robust foliage. The blooms are produced in great profusion, of a gigantic size, beautifully fringed, and the colour is a very beautiful shade of a rich deep red.  
Per packet, 6s.

For full descriptions of above see  
**ILLUSTRATED SEED CATALOGUE for 1896,**  
which will be forwarded, gratis and post-free,  
to all applicants.

**VEITCH'S GENUINE SEEDS**

**A FIRST-CLASS EARLY PEA, VEITCH'S CHELSEA GEM.**

An extra early dwarf variety of great merit, growing about 15 inches in height, and of compact short-jointed habit; it is as early as AMERICAN WONDER, and gives a much larger crop, bearing an abundance of handsome pods, which are half as long again as those of any other first early dwarf kind. The pods, which are produced in pairs, are remarkably well filled, and contain eight to ten good-sized Peas of first-rate quality. First-class Certificate.  
Per Quart, 2s. 6d.

From Mr. D. S. MELVILLE, Poltalloch Gardens,  
Lochgilphead, N.B. January 13, 1896.

"Your Chelsea Gem is a most productive and very early Pea; in addition to this the flavour when cooked is first-class."

**A FIRST-CLASS SEEDLING MELON, HERO OF ISLEWORTH.**

Award of Merit, Royal Horticultural Soc., August 8, 1893.  
First-class Certificate, the Richmond Horticultural Society,  
June 27, 1894.

A seedling of special merit. The fruit is oblong in shape, with a deep green skin, beautifully and thickly netted. The flesh is green and of great depth, with small seed space, and is of delicious flavour. It is a free cropper, bearing medium-sized fruits, 3 to 5 pounds in weight, and unlike many of the green-fleshed varieties, the plants produce short-jointed wood, cropping close to the stems of the plants, and coming to maturity in a short time.  
Per packet, 2s.

Mr. MELVILLE again says, with reference to this:—  
"Your Hero of Isleworth was the favourite Melon here last season."

DESCRIPTIVE CATALOGUES POST-FREE.

**THE BEST FRENCH BEAN FOR FORCING.**

**WEBBS'**

NEW

**'HUNDREDFOLD.'**

This new variety is specially adapted for forcing purposes, being very early, of dwarf growth, and remarkably prolific, whilst the pods are of the finest flavour.

2s. per Pint, post-free.

From the Rev. C. E. BLENCOWE, The Vicarage,  
Maraton St. Lawrence.

"Webbs' 'Hundredfold' Dwarf Bean proved very good for forcing. They seemed to bear very freely, and the Beans were very tender and delicate—more so than is usually the case with Dwarf French Beans."

THE  
**Gardeners' Chronicle.**

SATURDAY, JANUARY 25, 1896.

THE JARDIN D'ACCLIMATATION.

THIS is situated in the Bois de Boulogne, Paris, and is reached from the Porte Maillot, close to the Arc de Triomphe, by means of convenient, Liliputian tram-cars, which wind in and out among the leafy glades in a delightful manner. At first one wonders at the prevalence of so much copse wood, till memory recalls that sundry German soldiers were here encamped only a quarter of a century ago, and that these invaders were not likely to have been very sentimental about trees. The Jardin is a sort of compound of the Royal Botanic and the Zoological Gardens, with a dash of South Kensington, a strong reminiscence of the Fisheries Exhibition, and of the former conservatory of the Royal Horticultural Society. In any case, it is one of the most charming and most interesting places in the vicinity of Paris, and one which contains so much of interest for gardeners of all degrees, that no excuse is needed for drawing the attention of our readers to it.

The winter garden, in particular, should be carefully studied by those who may be called on to construct or maintain a similar establishment. It consists of an elliptic nave of iron and glass, with a curved roof, and surrounded by an aisle-like gallery, from which branch off on the one side a series of show-houses—side-chapels we were about to call them, whilst on the other side is a long building used as a cool conservatory for Camellias and New Holland plants. From the central nave access is also obtained to a fine concert hall and to a "Palmarium." The floor of the nave is depressed in the centre, the soil being thrown up into gentle undulations. These are covered with a dense carpet of Selaginella and Tradescantia, so that the soil is not visible.

A small lake with meandering streamlets crossed by rustic bridges, adds to the effectiveness of the scene, and contrasts well with the bold masses of rockwork in the vicinity. The planting of the banks, rocks, grottos, and mounds, has been excellently done. Here groups of Palms or bold Araliads, there of Tree Ferns; in one place a thicket of noble foliaged Aroids or feathery masses of trailing Asparagus, in another the graceful shaft of a Palm standing isolated on the turf, and bearing a spreading crown of foliage, and a wealth of tresses of flower. Noble Musas give dignity of form, whilst Dracaenas, Crotons, and foliage Begonias add colour. It must be added that the young foliage of some of the Palms—for instance of Kentiopsis macrocarpa—is as charmingly coloured as are the lower-growing plants just named. The water and surrounding banks are tenanted with appro-

private vegetation, such as *Monstera*, *Papyrus*, *Pontederia*, aquatic Ferns, and *Nymphæas*.

Ranging round the nave at several feet above the ground in the aisle-like corridor before-mentioned, bordered on each side by clumps of Bamboos (*Bambusa aureo-striata* was the name given). These alternate with fine plants of *Strelitzia Augusta* or *Regina*. From this gallery the visitor overlooks the nave below, and obtains a delightful view of the varied vegetation beneath, and from it opens out a series of minor houses devoted to various plants. Thus, at the time of our visit, at the end of October, one house was ablaze with *Chrysanthemums*, the flowers not so large as with us, and, it may be, not so "finished," but withal showing more taste in grouping and in blending of colours than we are accustomed to at home. In this house also were some Orchids. *Cypripediums* filled a second compartment. In the adjoining section was a group of *Anthuriums*, with noble leaves and brilliantly-coloured spathes. This was followed by a house filled with *Nepenthes*, *Vandas*, and various Orchids. Its neighbour gave shelter to a bright group of *Caladiums*, *Crotons*, and other showy foliage plants. The next house was devoted to a remarkable collection of *Bromeliads*, so strangely neglected here. These are show-houses which the public is allowed to gaze at, but not to enter. Doubtless, application at headquarters would enable the student to examine the plants at closer quarters. In any case, the effect was charming, and the grouping instructive. Indeed, though the amenities are here most prominent, an educational purpose evidently runs through the whole establishment, and the delighted onlooker soon finds himself asking questions and framing theories, showing that the intellect as well as the senses have been stirred by this charming winter-garden. A full list of the Palms, with their heights and other particulars, might be useful to the gardener. We had no time to compile such a list, but we may mention a few of the more striking Palms just as they were entered in our note-book, and which will at least convey to the gardener some idea of the furnishing of this beautiful house. The reader who does not care for a mere list of names is respectfully counselled to skip this paragraph:—

*Areca sapida* and *Baueri*, *Arenga saccharifera*, *Washingtonia filifera*, *Hydriastele Wendlandiana*, *Kentia Fosteriana*, *Belmontiana*, and *Canterburyana*, *Kentiopsis macrocarpa*, *Livistona Hoogendorpii*, *Livistona chinensis*, *Raphis Sirotkik*, *Cocos Romanzovii*, with very elegant narrow pinnæ; *Scaevola elegans*, in flower. No doubt there were many more, but those named were among the most conspicuous.

Leaving this winter-garden with reluctance, running back again and again to look at it from a fresh point of view, we at last tear ourselves away and enter the Palmarium. We have not so much difficulty in conveying to the reader what this is like, as Messrs. Jönvet & Co. have allowed us to purchase from their *Magazin Pittoresque* an illustration (fig. 17, p. 111) which conveys a very good idea of the building. Those who remember the conservatory at South Kensington, will recognise the resemblance between the two structures. It measures, we were told, 50 mètres by 21 mètres in breadth, and 14 mètres in height (164 × 68 × 45 feet).

The central avenue is flanked on either side by elegant Palms, *Cocos flexuosa*, which already reach nearly to the top of the building. They were reared, we believe, at Nice, and transferred to their present quarters in 1882. An inner row of fan-Palms (*Chamerops*) forms a fine contrast to the elegant *Cocos*; whilst in the gallery above, are some fine specimens of *Phoenix in tuba*. As will be seen, the Managers of the *Société d'Acclimatation* manage to combine means of practical utility and scientific study with amusement and recreation. This combination was tried with disastrous results at South Kensington, but the circumstances were so different that it would be useless to institute comparisons.

Familiar with the plants placed at the disposal of the fellows of the Royal Horticultural Society at Chiswick every year, we were not a little struck on entering one of the houses of this establishment, to see so fine a stock of Palms, *Cycads*, *Dracæas*, *Aran-*

*arias*, and other plants suitable for the decoration of apartments. These, it appears are not distributed to the subscribers, but are sold to the public at what seemed to be reasonable prices. Whether such a sale of plants at Chiswick would or would not be thought to be an unwarrantable interference with the privileges of the trade, we cannot say. In any case, the Paris public can get for its money far better and more interesting plants than those which are grown for gratuitous distribution among the Fellows of the Royal Horticultural Society.

The Garden-Director is M. Patry, who may well be congratulated on the beauty of the arrangement and the thriving condition of the plants entrusted to his care. We have confined ourselves of necessity to the vegetable kingdom, but as a zoological garden the *Jardin d'Acclimatation* is also remarkable; and museums, lecture-rooms, concert-halls, and the inevitable "Café," constitute an establishment which no visitor to Paris should omit to see.

## ORCHID NOTES AND GLEANINGS.

### CYPRIPEDIUM VILLOSUM TRUFFAUTI.

(*Hort. Truffaut.*)

This is a beautiful variety of the well-known *C. villosum*, and probably a natural hybrid between *C. villosum* and *C. villosum* var. *Boxalliatratum*, which gained a Certificate of Merit at the last meeting of the Orchid Committee of the National Horticultural Society of France. The leaves are much broader and longer than in the type, and much resemble those of *C. Sanderianum*, with very few brown dots at the base. Scape erect, hairy, bract longer than the ovary. Flower larger than in the type, with a glossy varnished surface. Upper sepal broadly open, margins revolute towards the base, irregularly covered with many confluent mahogany-brown spots, and of a purplish colour, near the margins pure white. Lower sepal large, dull yellow-green. Petals ciliate, spatulate, much broader than those of *C. villosum*, spotted at the base with a few dots, clear purplish brown, and regularly coloured in the middle. Lip of a quite different shape, much in the way of that of *C. Sanderianum*, lemon-yellow at the base, shaded with purplish-brown at the front. Staminode with a small glandular boss in the middle. The unique plant was found amongst a lot of imported *C. v. Boxalli*, and flowered in M. A. Truffaut's nursery, Versailles, January 18 1896.

## FORESTRY.

### THE ONE-LEAVED SCOTCH PINE (*Pinus sylvestris monophylla*).

UNTIL recently, I had no idea that the above was a distinct and well-marked variety. When seen from a distance, it bears some resemblance to *P. halepensis*, but closer examination reveals the fact that it is at once the most distinct and remarkable of the numerous forms of our native Pine. Unlike not a few varieties of *Pinus*, the distinguishing characteristics of *P. sylvestris monophylla* are present in every branch of the specimen I examined. As might be expected, the whole appearance of the tree is scant, and far less ornamental than that of the parent, this being readily accounted for by each pair of leaves being joined together for almost their entire length, and also from the foliage being tufted towards the tips of the branches, thus leaving the shoots bare of leaves for often a couple of inches in length. The leaves are shorter than those of the species, hardly exceeding 2 inches in length, slightly twisted, and glaucous-green in colour; while the sheath is jet-black, and a quarter of an inch long. Like the variety *P. s. horizontalis*, syn. *montana*, the buds of *P. s. monophylla* are more elongated and of a deeper red than those of the species. Very distinct are the sparsely-produced cones, these being globose, 1½ inch long, by nearly the same in greatest diameter, and composed of thick, light-

brown scales, with a small recurved nubo to each. They are sessile, and produced invariably singly. The general habit of the tree is much like the species, and the colour of the bark exactly similar. Judging from the exposed position in which the tree (from which these notes were taken) is growing, also the well-furnished stem, it would seem to be as hardy as the parent.

As an ornamental tree this variety of the Scotch Pine is not to be recommended, but its very constant and distinctive characters justly entitle it to the varietal name which has been bestowed upon it. *A. D. Webster.*

### THE SCOTS PINE.

We occasionally hear complaints of the inferior quality of the timber of this tree, of its being white and soft throughout, without any core of hard resinous wood. This is the common wild variety, *Pinus sylvestris vulgaris*, the *P. s. genevensis* of the French, and of little value as a timber-tree. It is very prolific of seed, and therefore much favoured by those who collect seeds, and are paid for quantity instead of quality. Undoubtedly the best variety is *P. s. horizontalis*, the *Sjeyde* Pine. Don, of Forfar, says, that "it differs from *P. s. vulgaris* by the disposition of its branches, which are remarkable for their horizontal direction, and for a tendency to bend downwards close by the trunk. The leaves are broader than those of *P. s. vulgaris*, and serrulated, and not margined; they are distinguishable at a distance by their much lighter and beautiful glaucous colour. The bark of the trunk is not so rugged, its cones are thicker, not so much jointed, and smoother. The tree seems to be a more hardy plant. It grows very freely, and quickly arrives at a considerable size." The wood of *P. s. horizontalis* is red throughout, and abounds in resin; so that planters should not be in doubt as to the variety to plant. The white-wooded variety is also a mean-looking tree compared with the former, and purchasers should always insist on being supplied with the superior variety. The varieties of the Scots Pine are, as most foresters know, somewhat numerous, and not all of them produce good timber. The hooked-coned varieties—*P. s. uncinata*, *P. s. hagenensis*, and *P. s. rigensis*—are to be recommended for their fine timber. *P. s. hagenensis*, introduced from the forests of Hagenau and Rastadt, grows to a height of 70 to 80 feet, with a straight, smooth bole, and reddish bark. *P. s. rigensis* is a common forest tree in Lithuania and Livonia. It does not differ in any particular from the best strain of Scots Pine found in Scotland.

### THE YELLOW NECTARINES.

OF late years there have been considerable additions to the existing yellow-fleshed Nectarines, and for these valuable additions we are mostly indebted to the skill of Messrs. Rivers, The Nurseries, Sawbridgeworth, Herts. These varieties are noted for fine flavour, indeed, many persons prefer a yellow-fleshed Nectarine to a white one; and most of the varieties are of large size, and the trees free growers. One of the first yellow-fleshed Nectarines was Pitmaston Orange, a variety raised at Pitmaston House, Worcester. Having been in early life a resident in that locality, I have always had a fancy for this variety. The good qualities of Pitmaston Orange are so well known that nothing need be said in its praise; still, it will be admitted that in cold heavy soils it is not the best Nectarine to plant, but given a south or west wall, and a warm soil, it is a delicious fruit, and the tree a free bearer. The tree not being a robust grower, makes a good forcing variety, and it is certainly one of the best for growing in a wall-case or house to supply fruit in July and August. An equally good yellow variety is Pine-apple, later than Pitmaston, a large handsome fruit, of nearly oval shape, the colour deep orange and crimson; very rich in flavour, and in season early in September. A seedling from Pitmaston Orange, it is harder than that variety, and excellent for a wall, if its needs be well attended to, and the roots kept near the surface; it does equally well as a forcer, and attains to a good size.

Another yellow-fleshed variety is Humboldt—in fact, one of the very best, equalling the last-named in flavour. It is a seedling from Pine-apple, and is in season at about the same time or a trifle later. Last year I gathered fruits of it in the last week in August; but the trees were much exposed, and the season, as we know, was exceptional. This is a fine forcing variety, and good on open walls when the wood is well matured, and not crowded in any way. In the season of 1894, Humboldt, though later than usual, was excellent, in spite of the weather being unfavourable, thus showing its adaptability as a wall

vating in pots or in the orchard-house. I prefer Pine-apple and Humboldt for the open-air, for the reason that the fruits are large; but Goldoni is free in growth, and very prolific.

Darwin is another yellow-fleshed variety, noted for richness of flavour, a seedling from Rivers' Orange crossed with the Stanwick, a noted kind for flavour. It is usually in season early in the month of September, but in 1895 it was earlier. I have no trees in the open, but in a late house the fruit is excellent. Byron, another yellow-fleshed Nectarine, has fruits above middle size, late, large, and good. I have no tree

England when it is comparatively plentiful in this market, and if a trade in Asparagus could be established, it would be of considerable advantage to the vegetable growers of the colony. The experience gained in the trials made at the refrigerating works shows that Asparagus will keep well in the cool chamber for six or seven weeks, and some bunches stored for that time proved, when cooked, to be succulent, tender, and of equal flavour with Asparagus freshly pulled. It is probable that a trial shipment will be shortly sent to England, and should the Asparagus prove acceptable to English consumers, it may find a regular place during the season among the articles exported.

AMERICAN GRAPE-VINES IN THE ROYAL HORTICULTURAL GARDENS.

The Gardens, Richmond Park, continue in a highly creditable condition, notwithstanding the fearful drought that has so long prevailed. With very few exceptions the trees and Grape-vines are in excellent condition, nearly all making splendid growth. Though some of the trees are showing plenty of fruit of good quality, the crop will not average heavily this year. The Grape-vines, however, constitute the most interesting sight. Those in the collection have already made shoots of 6 feet and upwards in length, and most of them are in fruit. The young seedlings of the Phylloxera-resisting American Vines, which, it may safely be said are in millions, are a notable feature. The seeds were sown in August, and the young plants are coming forward fairly well, even though somewhat overcrowded. Mr. Neilson, having had doubts regarding the quality of the seed, sowed it more thickly than proved to be necessary.

SOUVENIR DE LA MALMAISON, AND OTHER CARNATIONS.

The desire to excel in the production of immense blooms of the first-named fine variety of Carnation has reached Australia, and very beautiful blooms of this and some other varieties were to be observed in a florist's shop in Melbourne at the beginning of December.

AN EXTRAORDINARY CARROT.

I FORWARD to you a Carrot of the most curious growth that I have ever seen. The main root being surrounded by no fewer than nine other roots, the consequence being a monstrous root, or more properly, a conglomeration of roots or Carrots of peculiar and varied sizes (fig. 15). I have seen double and treble-rooted Carrots, but never anything at all resembling the one I now send. It was grown here at Sevennaks, by Mr. Holmes, of St. John's, who kindly presented it to me, as something worthy of more than ordinary notice. *Harrison Weir.*

[We suppose that the original crown was injured by the thrust of a digging-fork, which resulted in the formation of new branches. ED.]

NATURAL HYBRID ORCHIDS.

WHEN, in October, 1856, Mr. James Veitch, of the Royal Exotic Nursery, Chelsea, brought to Dr. Lindley a flower of *Calanthe* x *Dominii*—the first artificial hybrid which flowered—that acute botanist is reported to have exclaimed, "Why, you will drive the botanists' mad!" a remark indicative of the spirit in which hybrids generally then, and even afterward, were regarded by systematic botanists. Lindley belonged to a broader-minded school. "Although mule Orchids have never before been obtained artificially," he remarked, "are we quite sure that they have not been produced spontaneously? This is a grave botanical question which science cannot elude. It must be looked in the face; and if it should appear that species have been unduly multiplied in ignorance of so important a fact, why, in that case, botanists must retrace their steps as best they may. It is greatly to be feared that they will be compelled to do so. . . . In the genus *Orchis* are most suspicious forms placed

FIG. 15.—AN EXTRAORDINARY CARROT.

tree. Young trees cropped freely, and the fruits were of a good size. There are other good properties possessed by the yellow-fleshed varieties: the fruits hang a long time after ripening, and do not shrivel quickly, as do the white-fleshed Nectarines, and colouring up grandly, they are useful late in the season.

Rivers' Orange, an early variety, and a seedling from Pitmaston Orange, is a delicious fruit, sweet, with all of the good qualities of the seed-parent, and ripening a week earlier than it. The fruit is of fair size, and the tree an excellent bearer in any form, and forced or not; it is one of Mr. Rivers' best seedlings. One of the earliest of the section is Goldoni, a medium-sized fruit of a bright orange colour, of very rich flavour, and juicy; in season in the middle of August, and a grand fruit for culti-

ating in the open. It promises well, but is late, and late Nectarines in certain seasons do not ripen satisfactorily, and it is not advisable to have many trees. Where but few can be grown, my preference would be for Pitmaston Orange, Humboldt, and Pine-apple. *G. Wythes.*

COLONIAL NOTES.

ASPARAGUS FROM MELBOURNE.

WE read in the *Melbourne Leader* of December 7, 1895, that experiments have recently been carried out by the officers of the Agricultural Department in the cool chambers in Flinders Street with regard to the preservation of Asparagus for export. A vegetable dainty of this sort would fetch a high price in

round *O. militaris*, which demand careful study; there, also, we have *Morio-papilionacea* and *purpureo-militaris* of Tumbal, *Simio-militaris* of Grenier and Godroo, *Simio-purpurea* of Weddell, and some others, all probably natural mules. The genus *Ochrysis* will doubtless be found in the same state, and if so, what may not be feared for tropical genera such as *Ocoidium*, *Olontoglossum*, *Epidendrum*, *Dendrobium*, and *Cattleya*? Whatever else these facts and speculations may produce among them, this, at least, is certain, that in future too much care cannot be taken to avoid founding species upon marks of doubtful value, especially in dealing with garden plants. What with heteranthism, dimorphism, pelorism, and hybridism, our favourite *Ochids* may be found to assume as many disguises as an actor" (*Gardeners' Chronicle*, 1858, p. 4).

These remarks were prophetic, as the events of subsequent years have proved. The number of natural hybrids whose origin is no longer doubtful is very considerable, and is likely to be augmented in the future.

The genus *Odontoglossum* furnishes numerous examples; *Cattleya* and *Lælia*, with the combinations between them, follow closely; then come *Ocoidium*, *Miltonia*, *Cypripedium*, *Phalaenopsis*, and *Dendrobium*; while even *Masdevallia*, *Angraecum*, *Saccolabium*, *Vanda*, and *Cataeatum*, each afford a single instance of the occurrence of hybrids in a wild state, to say nothing of the numerous cases known among European Orchids. Some were originally described as species, and it is highly probable that other supposed species may yet have to be added to the list of natural hybrids. The two groups are essentially distinct in their origin, although there are no infallible marks by which they can be separated, and it may therefore be interesting to summarise what is known on this difficult but undoubtedly important subject.

Among tropical Orchids, *Phalaenopsis* × *intermedia* was probably the first recognised natural hybrid. It appeared in 1853 as a solitary plant in an importation of *P. Aphrodite*—long known under the erroneous name of *P. amabilis*—received by Messrs. James Veitch & Sons (then of Exeter), from Thomas Lobb in 1852. It flowered in the following year, when it was described by Dr. Lindley (*Pact. Fl. Gard.*, iii., p. 163, fig. 310), who remarked:—"It is not improbable that this beautiful plant is a natural mule between *P. amabilis* and *P. rosea*. It agrees with the former in foliage, and in the tendrils of the lip; with the latter in colour, in the acuteness of its petals, and the peculiar form of the middle lobe of the lip. . . . Flowers half-way in size, between *P. amabilis* and *P. rosea*." The name, of course, was given in allusion to this intermediate character. It is not a little remarkable that these remarks appeared in the very year that Mr. Dominy commenced his experiments in hybridising *Ochids* at Exeter, and five years before those relating to *Calanthe* × *Domini*, above cited. This single plant of *Phalaenopsis* × *intermedia* is said to have remained the only one known until 1861, when two more were brought home by a French trader named M. Porte, since which date it has appeared sparingly among importations received by different horticultural firms.

Some years later Messrs. Veitch, having already attained great success in hybridising Orchids, conceived the idea of testing Lindley's theory of the hybrid origin of *P. × intermedia*, and accordingly Mr. Seden made the experiment of crossing *P. Aphrodite* with the pollen of *P. rosea*. A capsule being obtained, the seed was sown in 1880, and in due time a single seedling appeared, which flowered in April, 1886, and vindicated the soundness of Lindley's judgment, for the artificially-raised seedling proved absolutely identical with the wild original. The practical importance of this experiment will be obvious to everyone. It proved by actual demonstration what before had only been a matter of conjecture—at all events, in the opinion of the sceptics. How nearly this interesting experiment escaped a disastrous end is now matter of history, and the story is so interesting in this con-

nection that it may be repeated in Mr. Veitch's own words:—"Among our earliest *Phalaenopsis* crosses we succeeded in raising a single seedling from a capsule of *P. amabilis* crossed with *P. rosea*, which we were particularly anxious to save, as it would have solved the question of the parentage of *P. × intermedia* or *Portii*, which is a supposed natural hybrid between the same two species. The plant had made three healthy leaves; it was well established in a small pot, which, to be more secure from danger, was placed upon an inverted pot of water. One morning it was discovered that a slug had eaten off two of the best leaves, and would, if not trapped, certainly devour the remainder. Anxious to save the treasure, the plant was watched incessantly for hours in the expectation that, sooner or later, the marauder would make his appearance; to induce him to do so, the moss was constantly plunged into water; the repeated duckings had the desired effect, the culprit issued from his lurking-place, and the plant was saved." (*Veitch, Journ. Roy. Hort. Soc.*, n. s., vii., p. 27.) A year after these words were written, the plant rewarded its deliverer by producing a raceme of flowers, with the result above-mentioned.

As long previously as 1787, Visiani had recorded the occurrence of a probable natural hybrid between *Gymnadenia odoratissima* and *Nigritella angustifolia* (then called *Ochis odoratissima* and *Satyrion nigrum*, respectively), which he described and figured under the name of *Ochis suaveolens* (*Hist. de Pl. de Dauph.* ii., p. 38, t. 1). The plant he had found in the Alps, near Grenoble, and remarked of it somewhat as follows:—"If it were possible to think of a hybrid, especially in a genus which is multiplied very rarely by seed, it would appear that its parents might be *Ochis odoratissima* and *Satyrion nigrum*," and he then went on to point out how it differed from the two species in question. It is now well-known under the name of *Nigritella × suaveolens*, and except that *Gymnadenia conopsea* has been substituted for *G. odoratissima* as one of the parents, Villar's opinion is universally accepted, though for a long time no one appeared to think it worthy of attention, and even Lindley in the year 1835 omitted all allusion to it (*Gen. and Sp. Orch.*, p. 281).

In 1830 a second natural hybrid was recorded under the name of *Ochis* hybrids, Bonningh. (*Rchb. Fl. Germ. Excurs.*, p. 125). It was said to be intermediate between *O. fœca* and *O. militaris*, with which it was found growing, and to be in all probability a natural hybrid between them. Lindley referred this to the latter as a variety (*Gen. and Sp. Orch.*, p. 271), but it is certainly a natural hybrid with the parentage indicated.

In 1852, Weddell figured and described a remarkable natural hybrid between *Ochis militaris* (then called *O. galeata*) and *Aceras anthropophora* (*Ann. Sc. Nat.*, ser. 3, xviii., pp. 1 to 6, t. 1). This he had found in the forest of Fontainebleau for the first time in 1841, but it was not described until met with again by M. de Jussieu eleven years later, in the same forest. He gave an excellent figure, with analytical details, both of the hybrid and of its two parents, which leaves no doubt whatever of the accuracy of his conclusions, as is further borne out by an examination of dried specimens.

Attention was thus being called to the subject, and three years later M. Timbal-Lagrave published his "*Mémoire sur de Nouveaux Hybrides d'Ochis et de Serapias*" (*Mém. Acad. Toulouse*, v., pp. 299, 300), in which additional evidence on the subject was brought forward. This I have not been able to consult in the original.

In 1855-6 the Orchids of Grenier and Godroo's *Flore de France* appeared, and here we find ten distinct hybrids described, besides one supposed reverse cross (to which no importance need be attached), and *Nigritella × suaveolens*—the original one of Villar—which, curiously enough, is treated as a species. In a note, however, the author's remark that Villar was probably correct in regarding the plant as a natural hybrid, except that *Gymnadenia conopsea*, and not *G. odoratissima*, was one of the parents. This view is now universally accepted.

These are the facts alluded to by Lindley when describing *Calanthe* × *Domini*; but it is interesting to note that his remarks about *Phalaenopsis* × *intermedia* were made even before the appearance of Timbal-Lagrave's memoir, and consequently at a time when very little was known on the subject. R. A. Rolfe.

(To be continued.)

## BROCCOLI.

THE severe weather experienced in the first two months of 1895, when the thermometer fell to zero, or below it, on several occasions in some parts of the country, played sad havoc among culinary vegetables, and particularly among Broccoli growing on heavy or damp soils, and where no means were taken to protect it. In many places where it succumbed when left to itself and totally unprotected, a fair proportion of the crop might have been saved had the simple method been followed of laying the plants over on their sides with their heads to the north, and covering their stems with earth laid well up to the base of the leaves. This should be done early in November, when the growth of the season is about complete, and before hard frost sets in. The yellow or decaying leaves should be stripped from the plants, and cleared out of the way. A couple of spits of soil should be then dug from the north side, and the plant pressed over until its head lies flat on the ground towards the north, when the soil is heaped over the recumbent stem, covering it with at least 3 inches of earth, and beating it firm and smooth with the back of the spade. The earth should be pressed well up over the base of the leaves, to protect the most vital part of the plant from being injured by severe frost. In open and well-drained garden soils nothing more is required; but in damp localities, subject to hoar-frost, a slight covering of Wheat-straw or Fern helps to protect the Broccoli from the evil effects of repeated freezing and thawing, which are often more detrimental to vegetables than a steady, lengthened spell of keen frost.

By the simple method above described of laying over the Broccoli plants with their heads to the north, and covering their stems with earth about the middle of November, we have lost not more than a small percentage of the best varieties in the severest winters of the past quarter of a century. Our main supply from November, when Veitch's Autumn Giant Cauliflower is over, till June, when Walcheren Cauliflower comes in, has been from four or five varieties; namely, Snow's Winter White, Veitch's Spring White, Dilcock's Bride, Lander's G'schen, and Veitch's Model; but almost all the popular varieties in cultivation have been tried at one time or another, with the view of retaining the best for our purpose. In rich garden soil, such as we have to deal with, no manure is given to the Broccoli crop, as it grows quite strong enough without, and if manured, the flavour is apt to be rank in the spring. Sown in April, pricked out in May, and finally planted out towards the end of June, strong, stubby, well-rooted plants, set about 2½ feet apart, they grow vigorously, and occupy all the space given them by the end of October. They are then robust, sturdy stock, in the best condition for laying over on their sides to come safely through the rigours of the winter. With such treatment, and all growing under the same conditions, at an altitude of about 200 feet, and in the latitude of Edinburgh, the following percentages of the varieties of Broccoli named came safely through the winter of 1894-95, and furnished a supply of excellent heads from early spring until Walcheren Cauliflower was ready in June. The numbers grown varied from 300 to 1,200, the largest quantities being the stock varieties already mentioned. Before the storm began at the New Year, about sixty per cent. of Snow's Winter White had been used, or were fit for use, but the remainder were rendered practically useless, owing to the absence of a sufficient depth of snow to protect them from the hard frost that prevailed till the end of February, when the season for that first-rate winter variety is over.

Taking them somewhat in the order in which the varieties came into use, the following were the number of heads produced, per hundred:—

Veitch's Fine Spring White	54 per cent.
Penzance Early	5
Purple and White Sprouting	12
Dilcock's Bride	65
Veitch's Main Crop	82
Improved Wilcox	87
Dalmeny May	42
Chelsea Favourite	70
Mauler's Dwarf	63
Lander's Goschen	74
Gordon's Niddrie	65
Veitch's Model	94

These figures show the severest losses among the Broccoli crop for more than twenty years past, owing, no doubt, to the small depth of snow, which was seldom more than an inch or two deep, and melted quickly with the sun, or was blown off the plants by the wind. The consequence was the destruction of the upper leaves of most of the varieties, and a higher mortality among the earlier varieties. They are all excellent varieties when well grown, and their hardiness is increased considerably when a little timely protection is given them. A good supply of nice heads of Broccoli in the winter and spring is always appreciated, and with such sure varieties as Snow's Winter White, Fine Spring White, Main Crop, Lander's Goschen, and Model, it is not difficult to accomplish under ordinary circumstances. *North Briton, January 7.*

## FLORISTS' FLOWERS.

### CHRYSANTHEMUMS.

THE earliest batch of cuttings should now be well supplied with roots. A position close to the glass in a house whence frost is excluded is all that is necessary. Artificial heat at this stage of growth should be rigidly avoided. Abundance of fresh air in suitable weather is beneficial to Chrysanthemums at all times, and at no other stage in their existence is it more important than now. Some few varieties of the earliest-struck cuttings may not be ready to be taken from the frames or handlights for another week or so. Gradual inuring to a free exposure is a much safer plan than exposing them fully at once. I find that cuttings require an exceptionally small quantity of water this season during the rooting period, consequent upon the absence of sun or frost, and consequent fire-heat. The strongest and earliest plants which have filled their small pots with roots should be shifted into larger ones. Do not allow the plants to remain even for a short time in pots too small for their roots. Not only are the plants thereby checked in growth, but the roots do not take to the new soil so kindly after they have become so matted together. The main point to observe in Chrysanthemum culture is never to give a check to the growth of the plants from the time the cuttings are inserted until the blooms are developed.

Pots 3½ inches in diameter are large enough for the first shift from the cutting-pots. A compost consisting of two parts fibry loam to one of half-decayed leaves, with sharp silver-sand added according to the character of the loam—heavy or light—is best for the first shift. Where the loam is poor in quality a small quantity of bone-meal, dissolved bones, or Thomson's Vine-manure, may be added at the rate of 2 lb. of each of the first-named two, and one of the latter. If the soil is passed through a half-inch sieve, the work of potting will be facilitated. The rougher parts are useful for placing over the crocks. Any stagnation about the roots in so young a stage may induce a sickly colour in the leaves. If the soil is moist, as it should be when employed, and the plants are watered previously to being potted, further waterings will not be necessary for several days. Press the soil firmly about the roots, and return the plants to their former position on the shelf close to the glass. Place a small stake to any that are at all weak, to induce them to grow upright. Water at this time of the year should always be given in a

tepid condition. Keep a sharp look-out for aphides and mildew. Dustings of sulphur will destroy the germs of the latter. Brown-coloured sulphur is preferable, as that of the ordinary colour is too conspicuous to be pleasant. Black and greenfly may be easily destroyed by dusting the points of the shoots with tobacco-powder. In extreme cases, it is well to dip the points of the plants or leaves in a strong solution of tobacco-water.

Pompon, Anemone-pompon, and single-flowered varieties cannot be too highly recommended for their decorative effect, either as plants or in a cut state. There is a peculiarity of grace about these sections that render them especial favourites wherever seen in perfect condition. The present is a good time to take cuttings of any variety in the above sections. By topping the plants once or twice, and allowing them uninterrupted growth afterwards, handsome decorative plants can be obtained. *E. Molyneux.*

### A WELSH SCOLOPENDRIUM.

IN fig. 16 we have illustrated a variety of Scolopendrium vulgare, which, so far as we are informed, has been discovered in no other district than South Wales. Fronds were sent to this office in 1880, and on p. 362, in the issue for September 18 of that year, were thus described under the name of *S. vulgare Daviesii*:—"It is a finely-developed form of the

FIG. 16.—SCOLOPENDRIUM VULGARE VAR. DAVIESII.

crispum type, with a sagittate base, and toothed margins—that is, the margins are extended into distinct, pointed, tooth-like, coarse serratures; in some of the fronds the apex is multiply lobed." The variety was discovered by Mr. D. M. Davies, in the neighbourhood of Brynmawr, in South Wales, who has now obliged us with a sketch of the plant.

### WILD GARDENS AND PLEASURE-GROUNDS.

(Continued from p. 75.)

PLEASURE-GROUNDS.—An important point in the formation of pleasure-grounds is to make them effective and interesting as near to the house as possible. A landscape-gardener should have an artist's eye, and be able to perceive the future effect of his work, as well as that of the present. One has often seen great mistakes made by ladies and gentlemen in planting trees and shrubs quite out of character with the surroundings, which, although effective for the time being, soon grow too large for the position in which they are placed. It is difficult in after years to rectify such mistakes without considerable labour and expense. Other cases occur where in a small space in which only one, or at most two, trees should have been planted, you find several, and in a few years they crowd each other, while the best tree or trees are in the wrong position. They are too large to remove, and the consequence is the whole thing is a failure.

It would be well if every gardener could afford to have a course of lessons on landscape-gardening, under a thoroughly good teacher.

I do not think it advisable to plant large or tall-growing trees too near a mansion, especially some of the Elms which are very dangerous when old, being liable to fall during storms [or in calms. En.]. Large masses are, in my opinion, preferable to the dotted system, and with Rhododendrons, Azaleas, and others, one can make the most beautiful and desirable effects. The *Andromeda formosa* is a lovely flowering shrub in early summer, when it is covered with bunches of Lily of the Valley-like blooms. I have seen it 12 to 18 feet high, and as much in diameter, covered with one mass of bloom, and it was really grand. It is also very handsome when making fresh growth, the young shoots are purple-heck in colour, and if the winter is not too early, you get a second bloom at the end of October. It is not nearly so much planted as I should like to see it. *A. japonica* is another excellent variety, whilst *A. floribunda* is presumably known to you all.

I should like to say a word on behalf of the true Indian Rhododendron and its hybrids, which prove with us hardier than hybrids of *R. Catawbiense* and others more generally planted. Last winter and spring were most disastrous to many plants, and it is with pleasure I am able to speak so highly of this class, as the frost had not the least effect upon them. *R. gloxiniflorum* (one of Mr. Veitch's introductions) was covered with bloom last Easter, and in the distance it looked like a mass of snow; *R. campylocarpum*, yellow or primrose coloured; *R. arboreum* and varieties, from white to rose and crimson; *R. barbatum*, scarlet; *R. Nuttallii*, white, and many others, with the dwarf *R. ciliatum*, had not a leaf injured; *R. formosum* (Gibson) also stood out and flowered, but was slightly injured, owing, I believe, to being planted late. I am raising seedlings from the above varieties, both true and hybrid. To convince you of the hardiness of them, I sow the seed outdoors without the least protection beyond that which their parents give them, and they are in all stages of growth, from this year's seedlings to plants 5 or 6 feet high which have bloomed. All are in the most robust health, and it is very interesting to watch them coming into bloom. The *Camellia* also is hardier than the common Laurel. I often wonder why it is not planted out more than it is.

Charming effects can be produced by planting climbing plants on trees, such as *Clematis Ampelopsis*, Vines with coloured foliage, especially *Vitis Coignetiae* (introduced from North Japan); this, I am told, is best of all for this purpose. I am planting several of them this season on trees, and I wonder the system is not more generally practised, as it prolongs the period of colour when flowers are scarce. An Ash tree with *Virginian Creeper* covering the bare stem for 20 or 30 feet, with the shoots of the trailer embracing the branches and hanging in festoons all over the tree in autumn, is perfectly lovely. *Clematises* of various shades on Apple trees, if allowed to grow and flower at will, are glorious, first the Apple bloom, and afterwards the colours of the fruits, blending with the *Clematis* flowers beautifully. In December I had Apple and Pear trees covered with *Jasminum nudiflorum* in bloom, the effect of which must be seen to be appreciated. There are many other things equally good.

In the case of large trees, and where there is a pinetum, several of the same species should be planted together, as one tree often fails to give a good exhibition of its class. Seedling Conifers vary very much in growth, especially those of the *Cupressus*. Evergreen trees where practicable, should, I think, be kept separate from deciduous ones. In large places this is not a difficult matter, but in smaller ones it may be so. Where this is the case, and only one or two of a species can be accommodated, the highest part of the grounds should be planted with the loftiest-growing trees.

Before closing, I should like to make a few remarks on the subjects that are not generally planted. The Flowering Ash (*Fraxinus Ornus*) is

not only beautiful in spring when in bloom, but also in autumn, when the foliage assumes a colour equal to many of the Maples. *Foraythia anspensaa*, trained as a standard, is quite lovely; it blooms very early, and appears to be unaffected by frost. Last spring it was in full bloom when the ground was covered with snow, and the contrast between its golden blossoms and the snow was a rare and pretty sight. Palms should not be omitted from pleasure-grounds. If possible, protect them from strong winds, or their foliage will be sadly disfigured. We have them, however, in full blast of the south-west wind from Dartmoor, and if they can withstand that they will grow anywhere. *Chamaerops Fortunei* is full of fruit, which will ripen this season at Whiteway. *Fuchsias* are not as freely planted as they might be, considering their beauty. I cannot find words to describe how lovely a mass of them is when seen in the setting sun. Cottagers appreciate them more than gardeners generally do, with the exception of a few old-fashioned men.

I think we miss a deal of beauty in our pleasure-grounds by neglecting so many of our own native trees, and I should like to recommend a book that everyone should read, *Our Woodland Trees*, by F. G. Heath. The description and hints he gives about trees are invaluable.

The different varieties of the Japanese Cypress (*Retinospora*), the Siberian Crab (*Pyrus Malus floribunda*), both in flower and fruit, are very beautiful; *Prunus Paeardi*, cut back and encouraged to make strong growth, is far handsomer than when allowed to grow naturally; *Clethra alnifolia*, *Colutea arborescens* (the Bladder-nut), and all of the *Rhus* family, are very lovely, the latter especially in autumn; *R. Cotinus* (the Wig tree), with its fluffy inflorescence, is a pretty subject on a lawn. Another very handsome plant is *Spiraea Thunbergiana*, both in spring and autumn; it is not unlike a graceful Bamboo in the distance. *Ealalia japonica*, *E. zebrina*, and others, are also worth planting as groups. For lovely colour in the landscape, *Acer saccharinum* (Sugar Maple) is very telling; in fact, all the varieties of *Acer* are good. The Japanese sorts have the advantage that they can be planted close to walks and roads, affording desirable little bits of colour. I must not omit the deciduous *Magnolias*, such as *acuminata*, *complanata*, *Lemne*, *Soulangiana*, &c., which flower so freely, even in a young state. *Lahurnum*, and the Judas Tree (*Cercis Siliquastrum*) show up better when they have a good dark background behind them. The white-flowered *Broom* also should be planted where a nice sheltered spot can be found, or its graceful branches will get very much punished with strong winds. *Desmodium penduliflorum* is a capital companion to this.

*Paulownia imperialis* makes one of the handsomest of foliage trees, if it is treated as a pollard. For grouping or fronts of beds, the *Hydrangea hortensis* and *H. paniculata grandiflora* are always welcome, especially the latter, as it produces long sprays of creamy-white flowers. *John D. Nanscawen, Whiteway Gardens, Chudleigh.*

## FRUIT REGISTER.

### THE SUDDUTH PEAR.

PROBABLY no new fruit has ever claimed a place in horticulture with as many remarkable qualities as has the Sudduth Pear, bringing a test covering more years than many of our leading varieties of fruit have been in existence.

The original tree growing near Springfield, Illinois, is seventy-six years old, and has never failed to produce a crop in forty years, bearing 80 bushels in a single season. The old tree has a bole over 10 feet in circumference, and some 55 feet in height, and it is claimed by parties familiar with the tree from forty to sixty years to be absolutely free from blight or disease.

Grafted trees of the Sudduth, their ages ranging as follows, six years, thirty years, forty-six years, fifty-two years, and fifty-eight years, carry all the

characteristics of the parent tree. The standard trees have come into bearing three years from the branch graft.

The fruit is medium size, ripening in October, and is almost coreless and seedless. It has always been almost entirely free from worms. Colour, when thoroughly ripe, a greenish-yellow; skin stronger than common. The quality is excellent for both a canning and dessert fruit, being preferred to all other varieties for preserving in the locality where it is known. *The National Nurseryman*

## THE WEEK'S WORK.

### THE KITCHEN GARDEN

By C. HERRIN, *Gardener, Droghda, Maidenhead.*

**EARLY PEAS.**—A sowing of Peas should now be made in either small pots (60's), on turves in which drills are cut out, or in shallow boxes for planting eventually on a warm border. I am aware that Peas are frequently recommended to be sown early in the present month, but having tried both early and late sowings, I recommend the last as being generally the more successful. With Peas sown early it often happens that when the plants are ready for planting-out early in the month of February, the weather is such as to prevent this operation taking place for some time, with the consequence of the Peas becoming unduly drawn, or if in pots, stunted through insufficient space for the roots. During the early months of last year, the ground being frozen, the transplanting of Peas to the open ground in February was impossible. I prefer to sow the seed either in 4½ inch pots or on turves, the latter when obtainable. These should be freshly cut, about 9 inches square and 4 inches thick, and these, if chopped again across the middle, will be large enough; i.e., 9 inches long, 4½ inches wide, and 4 inches deep. Lay the turves grass side down, and slightly scoop out a drill with a trowel; sow the Peas thickly therein, and cover and make level with fine soil. A suitable place for these turves is the floor of a Peach-house just started, or any other house with a temperature ranging from 45° to 50°. As to varieties, there are numbers of early Peas now to choose from; if dwarf-growing ones are selected then *Chelsea Gem*, *Sutton's Seedling*, and *English Wonder* are three good ones, taller growing Peas being *Ringleader* and *Veitch's Selected Early*.

**CAULIFLOWERS.**—If Cauliflower seed was not sown in the autumn for an early supply, or if any deficiency of plants exists, a few pans of 10 inches in diameter should now be sown. It is care be taken that the plants do not become drawn by crowding, and too much warmth or too little ventilation. Cauliflowers as early, if not earlier, than those from autumn sowings may be obtained in the months of May and June. Such early varieties as *Extra Early Forcing*, *Snowball*, or *First Crop* will answer admirably for this purpose. The seeds should be sown in a good holding soil, which is better if it be sifted. Place in a warm house, but remove them to cooler quarters as soon as the seed leaves appear. Later varieties, as *Early London* or *Pearl*, may be sown at the same time for a succession.

**LETTUCE.**—If not already done, a box of Early Paris Market Cabbage Lettuce or other approved early variety should be sown, and if Lettuces be in demand, a box or two sown thickly once a fortnight with any of the *Cos* varieties will prove useful for gathering for early use, taking the plants when quite young. Up to the present date there will have been little difficulty in maintaining a supply of Lettuce from the autumn sowings.

**HERBS.**—Such herbs as Tarragon, Sweet Basil, and Marjoram are often in request, and to keep up the supply, roots of the former should be lifted from the herb border and placed in heat. Seeds of the others may be sown thinly in small boxes of light soil, and as soon as the seedlings are large enough, pricked off into others, keeping them at the first in warmth of about 50°, but afterwards removing them to a cold frame.

**SPINACH.**—If Spinach be deficient in quantity, the earliest opportunity should be taken to make a sowing of the *Victoria* variety on a border facing south or west, and if sufficient space can be spared for planting out the Peas recommended to be sown on turves or in pots at a distance of 4 feet between the rows, Spinach may be sown midway between them.

## THE ORCHID HOUSES.

By W. H. WHITE, *Buford, Dorset.*

**CALANTHES.**—The *vestita* section of *Calanthe*, now gone out of flower, should enter their short period of rest, during which water must be withheld, and the plants be placed on a shelf free from drip, close to the roof, in the East India-house, or the plant-stove. Here they will obtain the fullest sunlight, and may remain till growths push out from the base of the last made pseudo-bulbs, when it will be necessary to re-pot them. The *Calanthes* of the *Ragnieri* section bloom later, and should be kept in their growing quarters and attended to in the matter of affording water.

**PHALÆNOPSIS.**—Such species as *P. Schilleriana*, *P. Aphrodite*, *P. amabilis*, and the supposed natural hybrid *P. leucorhoda*, will soon make an attractive display of bloom, and will require water to be afforded with great care, merely sprinkling the sphagnum-moss with a fine rose watering-can, so as to keep it alive, but on no account allow water to lodge in the centre of the plants, the leaves being liable to spotting if this occurs. The deciduous *P. Lowii* is now at rest, but it will not be safe to let the plant get very dry at the root; the roots will need to be sprinkled occasionally, so as to keep them in a condition of plumpness. When the plants have had their proper season of rest, that is, in the month of March, they will show that they are in keeping with the season and ready to put forth fresh leaves. When that occurs, re-surface the plants with living sphagnum-moss, and afford moisture plentifully from that time forwards throughout the summer.

**ZYGOPETALUM MACKAY** and *Z. M. var. crinita*, as they pass out of bloom, should either be re-potted or top-dressed, and a mixture of lumpy fibry loam, peat, together with plenty of broken crocks mixed with these will suit either to root in. *Zygopetalum maxillare* is a species that requires cool treatment, much warmth rendering it difficult to keep free from insects, and when once these have obtained a footing low down in the young growths they are nearly impossible to eradicate. Growth having now begun, an examination should be made every day for thrips, and if any are detected on a plant it should be forthwith placed in a house in which XL All Vaporiser will be used. The species last mentioned is found growing naturally on the stems of tree Ferns, upon pieces of which it is often imported, and any plants which may have overgrown these stems should have a fresh piece of stem, secured by wire to the old piece, to which the rhizomes will soon attach themselves. It is a species that should be afforded water liberally at all seasons.

**CATTELEYA, OR INTERMEDIATE-HOUSE.**—The plants of *C. Friesii* and its varieties, now fast pushing up their flowers, may, in order to bring their flowers to perfection, be afforded a little more water at the root, withholding it when the blooms fully expand, till the plants begin to make growth. *Catteleya chocoensis*, *C. amethystoglossa*, and *C. Walkeriana*, will now be about to flower, and require a similar kind of treatment. The last-named species produces its flower-spikes from the apex of deformed-like growths which issue from the last made bulb; and as soon as these growths are seen, the plant should be hung up to the roof in a light position in the Mexican-house. Keep all the plants which are dormant comparatively dry at the root till growth begins, remembering that only a small amount of moisture is needed to retain the pseudo-bulbs in a plump state. The distinct-looking *C. Schilleriana* having started to make growth, those plants which seem to require fresh material about the roots or more rooting-space, should receive attention. A very thin layer of coarse fibry peat is required by them to root in. Keep the plant well supplied with water whilst growing, and its foliage near to the roof on the lightest side of the East Indian-house.

## THE FLOWER GARDEN

By HEDLEY WARREN, *Gardener, Aston Clinton, Trin.*

**CENTAUREAS CANDIDISSIMA** AND **CLEMENTII.**—If seeds of these plants are sown at the present time, nice specimens, fit for planting out, may be obtained by the middle of the month of May. Sow in pans, in the gentle heat of a hot-bed preferably, and as soon as the seedlings are large enough to handle, pot them singly into thumbs, and return them to the hot-bed; or if the latter be not available, then to a house with a genial temperature, and when the plants have made sufficient growth, re-pot them into 60's, finally hardening off in a cold frame, or on a shelf in a cool greenhouse.

**PELAGONIUMS.**—Those cuttings standing in store pots may be shaken out of the soil and potted off singly, and placed in moderate heat. Marguerites wintering in cold frames may be similarly treated, afterwards removing them to a cool place, or reducing the temperature of the house in which they are kept.

**ROOTERIES.**—Sometimes a rootery is made an attractive feature of a well-kept garden, but it is also sometimes made as to be devoid of all natural grace by its monotonous construction. A rootery having been decided upon, the winter is a suitable season to collect together the materials for its construction, and the greater the variety of root-stocks, blocks, &c., that can be obtained, the better should be the results, if judgment be used in their disposal. A rootery is a place for planting almost any species of bulbous plants, Ferns, and flowering plants, consequently it may be made bright and attractive during the greater part of the year. Its position should by preference be on a natural-looking mound, bank, or the side of a dell. Let the roots be arranged rather irregularly, some being allowed to jut out prominently, so as to form bays which can be planted in a variety of ways to look attractive; but do not pile them up to any great height, there being a certain amount of instability in decaying wood—and do not make use of the roots of Coniferous trees. The following are some of the subjects that look in character with a rootery, *viz.*, Pampas Grass, Ivies, Virginian Creepers, Clematis in variety, especially Jackmanni, Periwinkles, Foxgloves, Ferns, many varieties of herbaceous plants, *Chenopoda*, Christmas Roses, the double-flowering Forsy, Saxifrage, *Cerastium tomentosum*, *Dianthus* (Pink), *Sedum* in great variety.

**MISCELLANEOUS OPERATIONS.**—Climbing plants and shrubs used as coverings to walls and trellises may now be pruned and tied in, but no hard-and-fast lines can be laid down for the doing of this, and it only need be said that regard must be had to the position and to the condition of each particular plant. In some instances it may be necessary to remove entire shoots, in others shoots may have to be pruned half back, or in other cases simply spurred in. *Ceanothus* should not be pruned severely, as most of the wood will, if well ripened, produce flowers, but it may need some thinning. The surface of flower-beds is sure to stand in need of a light pricking up, which is helpful to the plants, and it gives a tidier appearance to the beds.

**HYACINTHUS CANDICANS**, as a summer-flowering bulbous plant, has few equals for the embellishment of the shrubbery or wild garden; and a group when in flower forms a striking object, especially if associated with bronzy-leaved *Cannas*, or other plants having this sort of coloured foliage. Before the bulbs are planted, the soil should be deeply dug and manured. Place the bulbs not less than 3 inches below the surface. These soon establish themselves, and will not require any further attention for a number of years.

**FRUITS UNDER GLASS.**

*By W. POPE, Gardener, Highclere Castle, Newbury.*

**EARLY PEACH-HOUSE.**—The trees in flower should be lightly brushed over daily about noon with a camel's-hair pencil, or a rabbit's tail tied to a stick, so as to detach and distribute the pollen. Try to keep up a circulation of moderately dry and warm air, but do not exceed 50° at night until the fruit is set. Syringing should be discontinued for the period during which the bloom is perfect, and a genial air maintained by damping the paths and borders in the morning at daylight, and afternoon about 2.30 or 3 o'clock, and in accordance with the state of the air inside and outside. When the wood-buds have become fairly prominent, rub off a few of them, first taking those which come out behind and in front of the branches, side-buds being left a few days later before any of them are removed. If the border should stand in need of watering, use water which is 5° warmer than the average temperature of the house.

**THE SUCCESSION PEACH-HOUSE.**—Continue to syringe the trees in this division morning and afternoon, until such time as the blossoms begin to expand generally, and damp the paths and borders as usual, the night temperature being kept at 45° to 50° on mild nights, and 2° to 3° lower in sharp frosty weather. Admit a little air whenever possible through the day, and keep the warmth at 50° to 55° by artificial means, allowing a rise of 5° or 10° by sun-heat. It is good practice to fumigate a

Peach-house effectually once or twice before the flowers open, so that aphides may be kept in check till the flowers have set, and the trees well started into growth, when fumigation may again be done. Where certain kinds of plants such as Strawberries, and shrubs for flowering early, &c., are placed in the Peach-houses, they should be quite free from insects before being introduced. The pruning of the trees and cleaning of the late Peach-houses should now be finished. Do not crowd the bearing-wood, and be careful to prune to a wood-bud, or a triple bud which has generally a wood-bud between the flower-buds. When the trees are pruned wash them with a safe insecticide, or simply with warm soap-suds, as may seem desirable, before tying them to the trellis. The surface soil if sour or worn out, may be removed down to the uppermost roots, replacing it with adhesive loam, in a fresh state, charred earth, or garden refuse, and a good sprinkling of crushed bones. A mulch of short dung may be afforded, unless the trees are young, when no mulch should be applied till later in the year. If the borders are dryish, apply water liberally. Keep the house cool. All Peach and Nectarine trees growing in pots should be re-potted or top dressed, as may seem necessary, not interfering much with the roots in so doing. The soil for top-dressing should consist of three quarters turfy loam of good quality, one-quarter well-rotted manure, and a small quantity of old plaster or mortar broken to a fine state, or half-inch bones. This mixture will be suitable for re-potting the trees, and top-dressing and re-potting should always be done very firmly with a kind of wooden pestle of small size. The surface should be left perfectly level, and the space left for water not less than 1½ inch, and in the case of large pots 2½ inches is not too much.

**PLANTS UNDER GLASS.**

*By JNO. MCINTYRE, Gardener, Woodside, Darlington.*

**THE FERNERY.**—Few plants afford more pleasure to their possessors than fine Ferns, and if a house can be set apart for them, rockwork should be largely used in the fittings, so that many of the inmates may be planted out in borders, pockets, and other places. In this way alone can they be cultivated under glass so as to bring out their beauty. In arranging indoor ferneries, it is well to copy Nature in her arrangements so far as circumstances render desirable; and the present season is a good one to make a beginning. It is the best time to examine and put a fernery in order. Where Ferns have been planted on rockwork for some years, the plants will in many instances have become too large for their situations, hiding too much of the rockwork to make a nice effect. Such overgrown plants should be lifted, split up in several pieces, and replanted in the same as well as in other parts of the fernery. This kind of work needs to be thoroughly done once in three or four years, rather than doing a little of it every year, for the reason that one likes the fernery to look well in all parts as far as growth of the plants is concerned at one time. The soil which suits most Ferns should be of an enduring nature, and contain a good deal of fibre, or the heavy waterings which Ferns require will wash much of it away. Fibrous peats and leams in about equal ratio are best, and the sand used should be clean and coarse, and if broken sandstone and charcoal can be obtained, the mixture will be made more suitable.

**ARRANGING THE PLANTS.**—Tree Ferns look well dotted about, with dwarf species planted underneath them; and overcrowding of large growers should be avoided as much as possible. In many gardens Ferns must be grown like other plants, that is to say, in pots, and they should have the best places found for them in the different structures in which they are cultivated. Exhibition Ferns have of necessity to be grown in pots, pans, or tubs, and for large specimens I prefer the last, only they should be made of durable wood, and be furnished with convenient handles.

**POTTING.**—Much care is called for in the potting or tabbing of specimen Ferns; the drainage needs to be very carefully placed, so that no hindrance to the exit of the water can take place; for although most Ferns delight in abundance of water at the roots, none will thrive if the drainage be defective. The soil should be put in when potting in small quantities, and the lumpy portions, which should be fairly abundant, should be intimately mixed with that which is finer, and all should be made fairly firm, but no rammer should be used, except at the

finish. Leave ample space for water, and do not cover the ball with more than from ½ to 1 inch of new soil. If the *Adiantums* are largely grown for cutting and other purposes, they should be cultivated in batches, potting and starting them into growth at intervals of six or eight weeks, and in this way *Adiantum* fronds may be had in good condition all the year. For all useful purposes, 3-inch pots are the most serviceable for these species, and the soil best suited to them is two parts good fibrous loam, one part fibrous peat, one part leaf-mould and sandstone broken up to the size of Hazel-nuts. The first batch may be potted at this date, and placed in heat of about 60° to 65° by night, and 70° by day, affording water sparingly for some time after potting, or until the roots have taken to the soil.

**THE HARDY FRUIT GARDEN.**

*By G. WOODGATE, Gardener, Rolleston Hall, Burton-on-Trent.*

**FRUIT BUDS AND THE BIRDS.**—Those small birds the bullfinch, tom tit, and sparrow never fail to pay visits to our fruit gardens during the early months of the year, and especially when the buds are about to burst open. If the gardener is not very watchful, these visits may not become apparent till a great deal of damage has been done. It is, therefore, much better practice to prevent their depredations altogether. What I do, and which I find efficacious, is to have the pruning of the Gooseberries, Currants, Plums, and Cherries completed as early as possible. Obtain some fresh-slaked lime (two parts) and soot (one part); intimately mix it together, and pass it through a ½-inch sieve—a barrel with one end taken out is a capital thing to sift it into, the sieve being placed over the top, which should be about the size of the sieve. The whole of the mixture can be expeditiously rubbed through the sieve without distressing the workman. A sufficient quantity of this mixture is put into a bucket with enough soap-suds to make it of the consistency of paint, and the trees and bushes are well syringed with it, the garden engine being used to distribute it over the larger trees. To prevent the nozzles being blocked, the mixture ought to be strained through a piece of coarse canvas. Lime and soot may also be used as powder; but to thus use it, a still day is necessary, the branches being wet with rain, or moistened by the engine, but it is more liable to be washed off by rain than when applied as a liquid.

**PEACHES AND NECTARINES.**—Trees which have been removed from the walls should have their branches secured in small bundles, and be fastened to the wall, or to stakes driven into the border. Here they may remain for a week or two longer, so as to retard the opening of the flower-buds; but if owing to mild weather the buds should become very prominent, the trees must be loosened from the stakes, &c., and secured in their proper position without delay.

**APPLES, PEARS, PLUMS, ETC.**—The pruning of all Apple, Pear, Plum, and Cherry trees, with the exception of any which were newly planted or transplanted, which may be left till growth begins, as well as the nailing and tying-in of wall trees, espaliers, cordons, &c., should be brought to a close. As soon as this is accomplished, afford the trees a dressing of soap-suds and petroleum, as advised on p. 15, applying it with the engine.

**CHERRIES, PLUMS, AND CURRANTS.**—These, if growing against walls, should have fish-netting suspended in front of them, to prevent the buds being taken by birds. If the walls have glass copings, the nets may be fastened to these, and made secure at the bottom with pegs, or be fastened to upright boards. If no coping exists, light poles reaching to the top of the wall, with the lower ends standing out 3 feet from the bottom of the wall, may be used instead, taking care that a sufficient number be used to prevent the nets touching the trees.

**FRUIT-ROOM.**—The fruit should be examined at short intervals of time, removing any that show signs of decay. As space increases, thin out the remaining fruit which, for lack of space, was stored too thickly at gathering time. Keep the room cool, dry, and darkened, and the temperature at about 40°.

**THE FIRST SNOWDROP.**—In an suburban garden, the first Snowdrop flower was observed on the 16th inst. The corresponding dates for the last few years were—for 1890, January 9; 1891, February 6; 1892, January 22; 1893, January 30; 1894, January 21; 1895, January 17; and 1896, January 16.

## EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

## APPOINTMENTS FOR THE ENSUING WEEK.

## SALES.

MONDAY,	JAN. 27	{ Continental Plants, Roses, Lilies, &c., at Protheroe & Morris' Rooms.
TUESDAY,	JAN. 28	{ High-class Perennials, Iria, Carnations, &c., at Protheroe & Morris' Rooms.
WEDNESDAY,	JAN. 29	{ Imported Japanese Lilies, Tuberoses, Begonias, at Protheroe & Morris' Rooms.
THURSDAY,	JAN. 30	{ Continental Plants, Gladioli, Hardy Border Bulbs, &c., at Protheroe & Morris' Rooms.
FRIDAY,	JAN. 31	{ Special Sale of Hardy Border Plants and Bulbs, at Protheroe & Morris' Rooms. { Imported Orchids, from Messrs. F. Sander & Co., at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—38°8.

Mr. J. C. ARTHUR has published an interesting paper on "Deviation in Development due to the Use of Unripe Seeds," in the September and October numbers of the *American Naturalist*, 1895. That unripe seeds could germinate was known to THEOPHRASTUS, 300 B.C., and has been the subject of investigation by many observers since. The author gives a very complete list of references to experimenters, alluding, among later ones, to DUHAMEL in 1760 (with Ash and Walnut), to SENEDIER in 1800 (Peas), and to SEYFFER in 1822. This last observer took unripe green fruit of *Sophora japonica*, dried it, and obtained 500 young plants, though, as a rule, the plant does not ripen its seed in Germany. He also refers to the exhaustive treatise of F. COHN in 1847, entitled *Symbola ad Seminis Physiologiam*, in which that author reviews the previous history, and records results of his own experiments with more than twenty widely-different species, raised from seeds in various stages of immaturity.

After discussing the disputed question as to what constitutes actual maturity, he quotes NOBBE'S statement as representing the present usage:—"The continued life of the embryo is not dependent upon the completion of the storing of reserve material in the seed; the power of germination appears much earlier, even in a stage of development of the seed undoubtedly to be designated as 'unripe.'"

The author then proceeds to give statistics from several experiments. Thus, "GOFF, in 1884, planted Tomato seed in March in boxes in the greenhouse, saved the previous season from fruit still thoroughly green, and obtained only 2 per cent. of vegetation. But of seed from fruit of full size, which had begun to lose its green colour, although not showing any tinge of redness, as many as 84 per cent. vegetated; while from fruit with a faint reddish tinge, the percentage of vegetation reached 100." "NONNE found that seed of Spruce Fir (*Picea vulgaris*), gathered on the 1st and 15th of each month, from the middle of July to November 1,

and tested in the laboratory in the following January, gave increased percentages of germination according to degrees of maturity. The percentages rose from 0, when the seed was gathered on July 15, to 40.8, on August 1; to 75.3, on September 1; and to 88.2 on November 1.

After recalling the fact that fruit may ripen after the bough which bears it has been removed from the tree, he adds that COHN first observed that green seeds entirely removed from the fruit and laid in moist earth or sand, passed through the various changes of colour of normal ripening. He experimented with seeds of Apple, Pear, Beans, Lupins, &c. LUCANUS corroborated this fact with Rye, showing that the weights of grain continued to increase, as the latter was left in the ear alone without the stalk; in the ear still upon the cut stalk; and lastly, with the roots in water. The general result is, that there is an optimum period for germination, as over-ripening is as harmful as under-ripening; since all grains after a longer and shorter time lose their power of germination.

Passing on to the effects, the first and most obvious in the germination of unripe seeds is the weakness of the plants and their under-sized condition. Many perish by failing to rise to the surface of the earth. The rate of germination is also slower than the normal. Thus with Wheat, of fifty grains, twelve still with milk germinated on the eleventh day; of grains turned yellow, nineteen had appeared in the same time: while of fully-ripe grains, twenty-five had appeared. "Owing to their weakened condition, the plants from immature seed are less able to withstand unfavourable conditions than those from ripe seed, the difference being more marked the younger the seeds. In my own attempts to grow very green Tomato seeds in the greenhouse, fully 85 per cent. of the plants that had unfolded the cotyledons, perished before reaching the third leaf." Similarly for winter Rye, WOLNY raised 41 per cent. from very green grain, 91 per cent. from grain in the milk, and 100 per cent. from pale yellow and from fully-ripe seed.

The author conducted experiments with Tomatos, and although the appearance of fully-grown plants did not always show their deficiencies, their weights revealed the fact that they had never recovered the ill-effects of the unripeness of the seeds when first they germinated. Thus, plants raised from the seed gathered from green fruit, gave the average weight of a single fruit in grms., 17.5; from half-ripe fruit, 17.9; and from fully ripe fruit, 19.4. These were calculated from 1044, 439, and 1889 ripe fruits respectively. From comparative results of growth, "without going into further details, the general principle may be stated, that plants from green seed will, as a rule, attain a smaller development in both vegetative and reproductive parts than those from ripe seed." But "the use of immature seed increases the reproductive parts at the expense of the vegetative, and thus it comes about, that there is more fruit formed in proportion to the amount of foliage than normally."

As the result of the cumulative effects of repetition through several generations, "it was found that a Tomato plant, selected as representative of the series grown from unripe seed, bore 3½ lbs. of fruit to 1 lb. of the leaves, stems, and roots taken together; while a plant of the same variety, grown each year under the same conditions, but always from ripe seed, gave only 1½ lb. of fruit for each lb. of the plant. . . . With this increased fruitfulness is also associated an increase in the number of fruits, although they are individually smaller, as also are the seeds."

Another feature of importance is the tendency to an increased earliness in ripening the fruit on plants raised from immature seeds. "In the cumulative trials with Tomatos by GOFF, just referred to, the strain from green seed ripened from ten days to four weeks earlier in different years than the corresponding series from ripe seed." The author supplies a table showing (in GOFF'S experiments of fifty seeds taken from each of the following stages of immaturity), the number per cent. which vegetated, and the number of days before the first ten fruits were ripe, as follows: From very green fruit, 2 per cent., 137 days; from pale green, 84 per cent., 157 days; from fruit tinged red, 100 per cent., 151 days; from light-red fruit, 96 per cent., 147 days; from deeper red, 88 per cent., 147 days; from fully-ripe fruit, 96 per cent., in 152 days. "This is not surprising in view of the fact that it is the weaker plants from which the greater earliness in fruiting is expected. . . . It was noted by GOODALE in 1885, and since by GOFF, that some early market varieties of vegetables indicated that they may have been originated from the use of green seed."

The author then summarises the results under the following heads:—(1.) There is a loss of vigour, shown in the smaller percentage of germinations, the weakness of the seedlings, and the greater number of plants which die before maturity; (2.) The full vigour of the plants is never recovered, although they may, and usually do, produce an abundant harvest, and one acceptable to the cultivator, in case of economic plants; (3.) The reproductive parts of the plants are increased in proportion to the vegetative parts, resulting in a greater number of fruits and seeds (although individually smaller), and more rapid ripening of them, than in similar plants from mature seed." The general interpretation he expresses in the following italicised sentence:—"The deviation in development, which comes from the use of unripe seed, does not differ in kind from that resulting from any other method of weakening the organism. It is only a special instance of the effect of checking the uniform normal growth of the individual." It has been long known that analogous results accrue from using very old seeds, as in the case of the Melon. Thus, M. F. CAZZUOLA found that Melons raised from fresh seed bore a larger proportion of male flowers than female; while older seed bore more female flowers. M. TRIEWALD grew twenty-one out of twenty-four Melon seeds which were forty-one years old. The branches were very slender, yet they produced both early and plenty of good Melons.

"The retardation of the germination due to age is well shown by the tests of Tomato seeds made by LOVETT, in which seeds from 2 to 6 years old showed the first germination in 10 days; 7 years, in 11 days; 8 and 9 years, in 12 days; 10 and 11 years, in 14 days; and 13 years, in 18 days. It will be observed that the effect of over-maturity is the same as results from immaturity. . . . It is evident, therefore, that ageing as well as immaturity of seed leads to weakness of the seedlings and a general lowered vitality."

Practical results may be deduced, which may be left to the experimenter to carry out, with such garden plants as are cultivated for their fruits. Like experiments should be made to test the effect of immaturity of the seeds upon plants, e.g., annuals, cultivated solely for their flowers; but for plants of which the roots, stems, and foliage are desired, it would seem that fully ripe seeds should always be chosen. For fruits, at least, it is quite evident that the cultivator may look for larger and earlier crops, though of diminished size, when immature seeds are used.

FIG. 17.—PALM-HOUSE IN THE JARDIN D'ACCLIMATATION, PARIS. (SEE P. 103.)

**A FRENCH NATIONAL ROSE SOCIETY** has, says the *Revue Horticole*, been established at Lyons. The society proposes to form a judicial committee to (1) examine, judge, and class the varieties of Rose; (2) to hold exhibitions and congresses in various French towns; (3) to publish information relating to Roses; (4) to furnish discriminating notes on novelties for the benefit of amateurs; and (5) to determine the nomenclature and synonymy of Roses. The Secretary is M. VIVIAND-MOREL, 66, Cours Lafayette à Villeurbanne-les, Lyon. The subscription is five francs a year.

**THE NATIONAL HORTICULTURAL SOCIETY OF FRANCE.**—We learn from the *Revue Horticole* that it is proposed to form a Rose committee in connection with this Society.

**THE SCOTTISH HORTICULTURAL ASSOCIATION, EDINBURGH.**—The annual general meeting of the association was held on Tuesday, 14th inst., at 5, St. Andrew Square. Mr. R. W. E. MURRAY, president, in the chair. The secretary (Mr. Robert Laird) submitted the nineteenth annual report to a full attendance of members, and stated that it was a matter of congratulation that the interest of members in the association was well maintained, the membership roll numbering about 500. The treasurer (Mr. Alex. Mackenzie) also submitted his report, showing that the association was financially in a thoroughly sound condition. In connection with the association a series of technical lectures was delivered, and thirty-two young gardeners had qualified for the final examinations in the different subjects. He had hoped by this time that they would have had a sum of £1,000 for the purpose of founding a horticultural institute in Edinburgh, in which they would have libraries and rooms for reference, where the members could consult books on horticulture at any time. Their progress towards this object was very slow, but he hoped that by strict attention to outlay and a larger liberality on the part of the members, they would eventually secure this very much desired want. The Duke of Buccleuch was re-elected honorary president, as was also Mr. R. W. E. Murray as president; Mr. Robert Laird, secretary; and Mr. Alex. Mackenzie, Treasurer. The following gentlemen were added to the council, viz, Messrs. D. P. Laird, Jas. Grieve, Wm. McKinnon, John Methven, Geo. Wood, Chas. Comfort, and George Broadfoot.

**HORTICULTURAL CLUB.**—The usual monthly dinner and conversation of the club took place on Tuesday evening last, at their rooms, Hotel Windsor. The chair was occupied by Mr. HARRY J. VERTCH, and there was a good attendance of members. A very interesting paper was read by Mr. H. SELFE LEONARD, on "The Arrangement and Planting of Rock Gardens." The paper gave rise to a profitable discussion, in which most of the points touched upon by the writer were considered. We believe that the paper will appear in a more permanent form in a short time. A cordial vote of thanks was accorded to the author.

**KEW SYSTEM OF GREENHOUSE CONSTRUCTION.**—The following paragraphs are taken from the *Kew Bulletin* for November, 1895: "The periodical reconstruction of the houses in which plants are grown under glass is a serious drawback to this method of cultivation. It is, however, practically impossible to avoid it as long as wood is employed, as that material sooner or later inevitably decays under the humid conditions to which it is necessarily exposed. To obviate this difficulty, iron has for some years been freely used in the construction of greenhouses at Kew. Ordinary iron is used for the rafters. The sashes, which can be easily replaced at any time if they become decayed, rest conveniently on the arms of the inverted L. This method of construction has proved perfectly successful, and the conservatory No. IV, as well as the temperate Fern-house No. III., are good examples of the method. The merits of this system have not escaped the attention of the horticulturists of other

countries. The Royal Board of Works and Buildings, Munich, and the Board of Commissioners of the Zoological Gardens, Rotterdam, have severally applied for detailed working drawings of the mode of construction employed in the Kew houses. And these have been furnished accordingly by the First Commissioner of Her Majesty's Works and Public Buildings."

**THE SALE OF WEED-KILLERS AND OTHER POISONS.**—Action has been taken against a large number of unregistered persons unlawfully selling poisons, keeping open shop for their sale, and using the title of chemist and druggist. In the majority of instances, the penalty incurred has been paid upon application in accordance with the provisions of the Statute. In the cases tried at Oldham, Carnarvon, Newcastle, Greenwich, Stonehouse, London, Edinburgh, Greenock, Ayr, Glasgow, Paisley, Salford, Bootle, Dandee, Forfar, Nottingham, and Dumbarton, decisions were given in favour of the Society, and penalties were inflicted on the offenders. Several prosecutions were instituted for the sale of arsenical preparations employed for killing weeds, ants, &c. In one of them, the defendants appeared, from the statement of their counsel, not to have been previously aware that the article sold came within the Statute, and to have given up its sale on ascertaining that it did. They were, however, fined in the full penalty, the Lord Mayor remarking that the respectable position of the company made the offence more serious. A seedsman at Helenburgh was fined for selling a similar preparation; and in another prosecution of a firm of seedsmen in Glasgow, under the 17th section of the Act, an objection was raised that the Procurator Fiscal was the only person competent to take action under that section. An assistant of the firm, who sold a similar arsenical preparation, was, however, convicted of an offence under the 15th section, but the Sheriff, in giving judgment, expressed himself as having no sympathy with the prosecution of employes. The mode of procedure peculiar to Scotland would appear, therefore, to offer some considerable obstacle to the administration of the Statute. *Pharmaceutical Journal*.

—On Dec. 30, Mr. T. Buss, County Coroner, held an inquiry at the Bicycle Hotel, Sevenoaks, Kent, into the circumstances attending the death of Ebenezer Upton, aged 44, which occurred on the previous Saturday, from the effects of drinking weed-killer containing arsenic. The jury returned a verdict of "Suicide during temporary insanity," and added a rider to the effect that the jurors "thought there should be some restrictions as to the sale and exposure of so deadly a poison. This was not the first case of the kind which had occurred in the neighbourhood, one on the Montreal Estate being the result of an accident. The label on the three-gallon jar of weed-killer found in the potting-shed was printed very indistinctly in small letters, and they thought the vessel should be kept under closer observation." *Pharmaceutical Journal*.

**RIVIERA NOTES.**—The best proof of the mildness of the season this year is the list of about 370 species in blossom on New Year's Day in the Marchese HANBURY's garden, as compared with 294 last January (see p. 42). Frost, in fact, has not yet made its appearance, and there is every prospect of an open winter that will permit the export of vast quantities of cut flowers to cities in less-favoured regions. The growing of Roses and Carnations is becoming an immense and important industry in sheltered spots along the Riviera; thus far demand has fairly kept pace with supply, but as Olive trees are felled by thousands, and the terraces turned into Rose gardens, prudent people begin to entertain grave doubts whether markets can be found for such vast quantities of flowers. The Olive crop is better than for years past, but storms have injured the fruit to some extent. Lemon trees suffered excessively from frost in January and February last, but have largely recovered. There are many complaints made of the miserable price that the fruit now fetches, Sicily securing most of the export trade.

**SPECIAL PRIZES AT THE NATIONAL ROSE SOCIETY'S SHOWS.**—Messrs. ALEX. DICKSON & SONS, of the Royal Nurseries, Newtownards, co. Down, desire us to inform our readers that a leading English amateur has undertaken to give a handsome Silver Cup and three money prizes to the amateur and professional divisions of the National Rose Society's competitions to be held at the Crystal Palace, Sydenham, in 1896 and 1897, for six and twelve distinct Roses, single blooms, raised or sent out by their firm. We may remind would-be competitors that, among fine varieties raised at Newtownards, are such fine Roses as Helen Keller (H.P.); Mavourneen (H.P.); Marjorie (H.T.), a beautiful variety of great merit; Mrs. W. J. Grant (H.T.), syn. Belle Siebrecht; Kathleen (H.T.), a perfectly formed flower of medium size; Sheila (H.T.), a very pretty garden variety; Marchioness of Downshire (H.P.); Mrs. R. G. Sharman Crawford (H.P.); Marchioness of Londonderry (H.P.); Margaret Dickson (H.P.); Marchioness of Dufferin (H.P.), and several others of much merit shown during recent years at the National Rose Society's exhibitions in London and elsewhere.

**LEEDS PROFESSIONAL GARDENERS' FRIENDLY BENEFIT SOCIETY.**—The committee and members of this useful society held a meeting on the 17th inst., at the "Green Dragon" Hotel, Guildford Street, Leeds, when the twenty-ninth annual report was read, and a detailed statement of accounts given, showing the exact position of the society in accordance with the provisions contained in the Registration of Friendly Societies Act.

The society's income for the past year has been ...	£ s. d.
144 4 6	
The expenditure has been for the same period ...	92 18 7½
Which leaves a saving for the year of ...	51 5 10½
This amount added to the savings twenty-eight previous years of ...	1106 3 10½
Makes the total amount placed to the society's credit of ...	1157 9 9
Representing the value of each financial member of ...	8 15 4½
And a net gain to each member for the year of ...	0 1 2½

The total number of honorary members is 19, and the total number of financial members is 132. There have been during the year 6 members initiated, which makes a total of 133. The committee congratulate the members on the favourable position of the society and its stability, and hope they will recommend it to all young men in their employ, who are eligible to join. The contributions are only 13s. per year. Thanks to the honorary members for the liberal support given, the committee is enabled to hand over from the management to the sick and funeral fund, the sum of £7 19s. 10½d. The secretary of the society is Mr. WILLIAM SONLEY, 8, Woodhouse Cliff, Leeds.

**THE WHITE CANNA.**—Hybridising Cannas with *Hedychium coronarium* was attempted, says Dr. FRANCISCH, in the *Florists' Exchange*, in 1893 by FRED. H. HOWARD of Los Angeles, but without success, owing, I believe, to the difference existing in the shape of the pollen grains of *Canna* and *Hedychium*. There was some hope of succeeding with *Myrosma cannaefolium*, which was described as having more structural affinities with the genus *Canna*; but after having patiently grown this plant for two years, when it bloomed at last it has turned to be just *Hedychium coronarium*, as it has happened with Mr. GERARD and others. To bloom well, *Hedychium coronarium* must be treated like an aquatic, indeed, and preferably in stiff soil. The finest plants I ever saw in bloom were just along a ditch taking the overflow of Mr. ED. STOUTEVANT'S aquatic pond at Los Angeles. In connection with this, I cannot see why plants could not be honestly called by their proper names. The appellation of white *Canna* given to *Hedychium*, of blue *Spiraea* to *Caryopteris*, of *Vanilla* to *Liatris*, are misleading and deceptive, and as such to be avoided.

**"AGENDA HORTICOLE."**—Under this title M. HENRY, the Curator of the Jardin des Plantes, has published a very useful little year-book, containing a variety of miscellaneous information. As showing

the difference between the education supplied in France and in this country, we call attention to the pages devoted to the national schools of horticulture and agriculture. Happily the discrepancy is not so great as it was; but we are still a long way behind. Appended to the volume is a blank diary for the year, so that the book is one of great utility to French gardeners, and will be serviceable also to many British ones. It is published at the office of the *Jardin*, 167, Boulevard Saint Germain, Paris.

**A TRADE GARDENER'S REQUIREMENTS.**—We have received the following letter, which was sent to one of our correspondents, who had applied for a situation as nursery manager or foreman. Names and addresses we omit for obvious reasons.

"London, E.C., January 18, 1895.

"Re Advertisement 'B,' *Gardeners' Chronicle*.

"Sir,—In reply to your letter dated December 20, 1895, will you kindly answer the following questions:—Have you ever produced stuff for the London markets—Covent Garden, &c.? Do you properly understand the succession of growing, so as not to have any blank weeks? At present there are twenty-one greenhouses, some out of repair. Can you glaze, paint, carpenter, see that boilers are in order, and put them in order if required? Can you *well* grow flowers, Roses, bulbs, Chrysanthemums, Ferns, Tomatos, Cucumbers for early and late forcing for market? Do you understand well the keeping-up of fires in the winter? There is a cottage in the nursery to live in. What is wanted is a thoroughly practical man who could build a greenhouse, put in boilers, pipes, lay the bricks, carpenter, glaze and paint, and, in addition, grow the stuff well for market. There is plenty of work to be done requiring strength, energy, and health. Can you grow Mushrooms for profit? Everything depends on making money. Salary and commission, and lodgings free. What wages and commission would you want? Commission would advance according to success. I presume you can keep ordinary accounts. Do you understand horses, stable work, &c. Do you know the London market regulations? Please write by return,

(Signed) \_\_\_\_\_"

**"THE CHRYSANTHEMUM ALBUM"**—In happy contrast to most of the catalogues we receive is *The Chrysanthemum Album*, issued by that enterprising cultivator and raiser, Mr. H. J. JONES, Ryecroft Nursery, Lewisham. Catalogues have many times given rise to justifiable complaints that the plates contained therein have given exaggerated ideas of the subjects they have portrayed; and it is, therefore, satisfactory to find that the camera is becoming more and more used for such purposes. In Mr. JONES'S *Album* there are included thirty-five excellent photographs of Chrysanthemum novelties, twenty-three of which have been raised at the Ryecroft Nursery, eleven by British amateurs, and one, viz., Hairy Wonder (which at this time, perhaps, can hardly be regarded as a novelty), raised in America. With one or two exceptions, however, the varieties are seedlings of 1894, and are now offered for the first time. The *Album* is dedicated to Sir EDWIN SAUNDERS, F.R.G.S., F.G.S., President of the National Chrysanthemum Society, of whom an excellent photograph is given in the frontispiece. There is also a photograph of the group of Chrysanthemum plants shown by Mr. JONES at the Aquarium show of 1895. The work is upon capital paper, with stiff paper covers.

**NEWCASTLE AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.**—The monthly meeting of this Society was held on Tuesday, the 14th inst., at 25, Westgate Road, and Mr. BULLOCK presided over an excellent attendance of members, Mr. MURRAY, Orchid grower to N. C. COOKSON, Esq., Oakwood, read an able paper on the Calathea, illustrating his remarks by cut specimens of many of the well-known hybrids raised at Oakwood. At the close of the paper many questions were asked relating to their cultivation, all of which were satisfactorily answered by Mr. MURRAY, to whom a vote of thanks was heartily accorded.

**SHIRLEY AND SURROUNDING DISTRICTS GARDENERS' AND AMATEURS' MUTUAL IMPROVEMENT ASSOCIATION.**—The monthly meeting was held at the Parish Room, Shirley, Southampton, on the 20th inst., Mr. W. DAVENPORT presiding over a first-class attendance of the members and their friends, Mr. R. E. O'CALLAGHAN, Vegetarian Union, London, gave a lecture entitled "Fruit as Food," profusely

illustrated with lime-light pictures, and of a most instructive character. Though not insisting on his audience adopting an entire diet of fruit, the lecturer urged the value of making fresh fruits in their seasons a portion of each meal, instead of restricting their use to dessert, when, he contended, they would be likely to do harm, as sufficient food of another nature had already been partaken of. He strongly advocated that more fruit should be grown in the country instead of importing so much, and thought some means should be taken to teach cottagers and small holders the methods adopted in France and Germany of drying certain fruits, Plums especially, which would save much waste, and in times of plenty, when prices ruled too low to allow a margin of profit on the sale in a fresh state, they might by this means get far more for their crops. A hearty vote of thanks was accorded the lecturer at the close. There was a good exhibition of Apples by the members, and the six dishes shown by Mr. J. MILES, gardener to Mr. W. PERKINS, Portwood Park, were grand specimens of size and colour, and received a Certificate. Some very fine Primulas (CANNELL'S White Perfection) were shown by Mr. KEATES, gardener to Mr. W. G. BUSHELL, and were very highly commended.

**LEE, BLACKHEATH, AND LEWISHAM HORTICULTURAL SOCIETY.**—From the report of this influential society, made at a meeting held on Monday, 13th inst., we learn that the summer exhibition was of a representative character, and the number of entries showed a tendency towards an increase, and to return to the larger number common some eight years ago. The cottagers' competitions were keen, and the vegetables exhibited excellent as regarded quality. There was a falling off amounting to a sum of £50 in the gate-money taken on the second day of the show, owing to a heavy rain occurring, which has led to the reserve-fund being entirely absorbed. The society will be entitled in the future the "Lee, Blackheath, Lewisham, and West Kent Horticultural," it being supposed that a greater amount of patronage would thus be secured. The winter session of lectures continues in popularity, and much information of a practical nature is imparted by their means. The dates fixed for the exhibition in the current year are July 8 and 9.

**ANTARCTIC EXPLORATION.**—It is satisfactory to find that there is a good chance of a scientific expedition being despatched to these regions, concerning which but little has come to light since the voyage of Sir JAMES ROSS. Some of our readers may remember that Sir JOSEPH, then Dr. HOOKER, formed part of this expedition. The results of that voyage, to confine ourselves solely to our own department, were very remarkable, and we can but hope this new venture will be equally profitable to science. Mr. T. GILBERT BOWICK, Royal London Yacht Club, 2, Saville Row, is the Secretary.

**MR. H. BRISCOE-IRONSIDE'S SEEDLING CHRYSANTHEMUMS.**—We are informed that Mr. H. BRISCOE IRONSIDE is returning to Italy, and that the whole of his stock of seedlings of Chrysanthemums on trial, numbering more than 100 varieties, has passed into the hands of Messrs. J. R. PEARSON & SONS, Chilwell, Notts. Mr. IRONSIDE intends to continue the work in Italy for the future.

**APRICOTS FROM THE CAPE.**—The steamship *Norman*, of the Union line, has arrived from the Cape, with the first consignment of fruit for the season; this was 1281 boxes of Apricots—all, we are informed, in very good condition, and which realised 5s. per box of fifty-four fruits. The next steamer is timed to arrive on the 1st proximo.

**NEW PUBLICATIONS.**—*The Orchid Hybridist's Handbook*, by A. E. HOPKINSON, illustrated. (Liverpool: BLAKE & MACKENZIE.) We shall have occasion to advert to this on a future occasion. — *Plant-Breeding*. Professor L. H. BAILEY has published in book form his five lectures upon the amelioration of domestic plants. The subjects dealt with are variation, as dependent on

or connected with sex; varying food supply, variation in climate, change of seed, struggle for life, &c. Similarly, bud-variation, the division of labour, and cross-fertilisation, are treated on. The book, therefore, is one specially interesting to the gardener, on which account we shall, later on, allude to it at greater length. It is published by Messrs. MACMILLAN.

## NOTICES OF BOOKS.

**WILD FLOWERS OF THE NORTH-EASTERN STATES.** By Ellen Miller and Margaret Christine Whiting. (New York and London: G. P. Putnam's Sons.)

This is a series of outline sketches of some 300 common North-Eastern American plants. The sketches are freely and accurately executed, but the almost entire absence of detail renders them of little value. The object of the artists, we are told, was to make the acquaintance of flowers "more easy to non-scientific folk than the much-condensed manuals of our flora are able to do." If the authors wished to interest their non-scientific friends they would have done well to have devoted more attention than they have done to the manners and customs and mode of life of the plants they have depicted. As it is, they give us descriptions which, while not rivalling in accuracy the descriptions of the text-book, are naturally diffuse and verbose, and no more entertaining to read than the more formal "characters" of the professed botanist.

**LA CULTURE DU POIRIER.** Par O. Opoix (*The Cultivation of the Pear*). (Paris: Octave Doin, 8, Place de l'Odéon.) Small 8vo, pp. 277.

M. Opoix has a well-deserved reputation as the head gardener of the Luxembourg in Paris, and his lectures and demonstrations are attentively followed. The present little volume contains a summary of the lectures given on the cultivation of the Pear, and is illustrated by more than 100 clearly-drawn sketches, illustrative of the conformation of the Pear tree, and of the manipulations to which it is subjected by the clever gardener. The subject is treated by M. Opoix under ten headings—1, the botanical history of the Pear; 2, the soils most suitable for its culture; 3, manures and planting; 4, the different organs of the extension shoots and their management; 5, the mode of training; 6, espaliers, orchard, and avenue trees; 7, grafting; 8, the diseases of the Pear; 9, the gathering and preservation of the crop; and 10, the best varieties. We find no mention of root-pruning. The numerous woodcuts so well tell their tale, that those not familiar with the French language can still profit by this practical little treatise.

**LES BROMÉLIACÉES, ETC.** Par L. Duval. (Paris: Octave Doin, 8, Place de l'Odéon.) [Bromeliaceae.]

For some reason or caprice, Bromeliads are not popular in this country. There is a fine collection of them at Kew; but we rarely see them in our hot-houses, and still more rarely in our drawing-rooms. On the other side of the Channel the case is different. You can scarcely go to a flower-stall in the marketplace without encountering some member of this interesting and beautiful family. Their cultivation, with few exceptions, presents no special difficulties; diseases are rare, insects easily kept under, so that few plants give more ample reward for the pains bestowed on them. M. Duval, in the little treatise before us, deals with the subject in a manner which clearly shows his great competence. His book is no mere paste-and-scissors compilation made to order, but is the production of one who knows not only what to say, but how to say it. For the general cultivation of these plants M. Duval recommends houses such as would be suitable for the cultivation of Orchids. M. Duval passes in review the several genera of most horticultural interest, and gives hints as to any special details of cultivation that may be requisite. This portion of the volume is enriched by numerous woodcuts, which are of real value, and not inserted for

ornamental purposes only. The species of Nidularium are those which are best suited for drawing-room culture, as being very resistant against unpropitious conditions. If insects are troublesome, the plant may be immersed in tobacco-water for one or two days in succession, and then be washed with pure water. A list of hybrid Bromeliaceæ terminates a little treatise which may be strongly recommended to amateurs as the production of a highly intelligent practitioner.

#### RUSTIC ADORNMENTS FOR HOMES OF TASTE.

By Shirley Hibberd. A New and Revised Edition. (London: W. H. & L. Collingridge, 148, 149, Aldersgate Street, E.C.)

This volume is divided into sections devoted to the following subjects: Floral Ornaments, the Fern-case, the Amateur Propagator, the Balcony and Window Garden, Conservatory, Greenhouse, Fern-house, Flower Garden, Marine and Fresh-water Aquaria, Fernery, Rockery, Ornamental Water, Summer-house, and Garden Accessories. It will thus be seen that, in peering these pages, the late Mr. Shirley Hibberd dealt with out-door as well as in-door decorations, and treated his subject at some length. This new edition of his book is prettily got-up, abundantly illustrated, and only so far altered as to bring the subject-matter up to date. Those who already know the work will welcome the present issue of it, which to them needs no commendation; while new readers in search of information on the topics herein discussed will do well to procure it, being sure that it will answer their requirements.

#### INTRODUCTION TO THE STUDY OF FUNGI: their Organography, Classification, and Distribution, for the use of Collectors, by M. C. Cooke, LL.D., &c. (Adam and Charles Black.)

A good comprehensive account of the general morphology and physiology of fungi, for the use of beginners and students, has become a necessity. Experts alone can be expected to keep abreast of the abundant literature pertaining to the subject, and they alone can form an adequate idea of the significance of the new discoveries which are constantly being made. The ordinary student of natural history requires a general statement of the leading features of the group, and specially such a presentation of the subject as will enable him to link on the prominent points of morphological structure to the corresponding points in other groups. The protean character of fungi, their varied phases of growth and development, invest them with extreme interest in the eyes of biologists. Dr. Cooke devotes nine of his chapters to a clearly-written account of the external characters of fungi and their several parts, and then proceeds to their classification. Upon this point Dr. Cooke mentions the principal attempts that have been made to group the fungi in a natural manner, and finally gives us the classification proposed by Brefeld.

The work is conveniently illustrated with woodcuts, but the mode of acknowledging the source whence the illustrations have been derived is peculiar and misleading. Any one reading the legend, "Bacterium termo, Chatto & Windus," might imagine that those gentlemen were the originators of the name, instead of being merely the lenders of the cut. Similarly, the initials, S. P. C. K., attached to some of the cuts, might, by analogy with H. B. & K., or R. & P., and other well-known composite initials, induce some to think that a quartette of botanists had co-operated in the nomenclature of a particular species. It is quite impossible to frame any but an arbitrary or conjectural census of fungi, but as attempts are made from time to time, some information as to the progress of our knowledge may be gained from statistics, in themselves of little value. Dr. Cooke's final conclusion is that, including the yeast fungi, the bacteria and the slime fungi, the total number of described species up to 1892 was 40,000. The next chapter, however, which shows how little we yet know of the

fungus vegetation of vast tracts in both hemispheres, also shows how little reliance can at present be placed on statistical estimates. A glossary and an index are useful features, but the index especially needs expansion and reconstruction—who would think of looking for what he wanted under such headings as "Old Definitions," "Growth of Bacteria," "Hypertrophied Basidia," "Imperfect Capsular Fungi," &c. It is true the transposition of the words would enable the student to find what he wants, but he does not expect to have the transposition to do for himself. The book offers many points for the critical botanist to exercise his skill upon, as Dr. Cooke is not always in accord with advanced views; but we cannot enter into these controverted points in this place, but conclude by thanking the author for the very comprehensive and serviceable treatise that has put before us. It cannot fail to be very useful as a starting point, and the bibliographies appended to

tomers in the same state as they are received from the manufacturers. They do not dispense poisons as druggists do, hence they do not require the same training. And if they can manage to get the Pharmacy Act amended, they will be quite pleased to keep a book for registering sales of weed-killers and insecticides, with the name and address of purchasers. I have never heard of any accident or injury to life resulting from these preparations being sold by seedmen, and as most nursery and seedmen require to use them themselves, they are the better able to advise and warn others how to take care of and use them. *Stet Veritas.*

**FARMERS AND FRUIT CULTURE.**—May I venture to express a hope that, in spite of your recent advice to farmers to adopt fruit culture, they will fail to regard that advice favourably? What do farmers know about such culture at present, and what prospects have they in their ignorance of competing with foreign experts, who have and do make

FIG. 18.—APPLE ROYAL LATE COOKING (THOMAS).

(Exhibited by Her Majesty, at the Royal Horticultural Society, January 14 1896.)

the several chapters will enable the student readily to obtain fuller information, and it may be different views, as to the nature and classification of these extraordinary plants.

#### APPLES ROYAL LATE COOKING AND LORD HINDLIP.

The two new varieties of Apples, illustrated in our present issue (figs. 18, 19), were shown at the meeting of the Royal Horticultural Society on the 14th inst.; and for a full description of them, we refer our readers to the *Gardeners' Chronicle* of the 18th inst.

#### HOME CORRESPONDENCE.

**WEED-KILLER AND INSECTICIDES**—I note your article on the vending of poisons, and consider the precautions recommended quite right and necessary. However, as weed-killer is put up in iron drums and tins, and insecticides in jars and bottles by the manufacturing chemists, the nursery and seed-trade do not break bulk, but deliver them to their cus-

tomers in the same state as they are received from the manufacturers. They do not dispense poisons as druggists do, hence they do not require the same training. And if they can manage to get the Pharmacy Act amended, they will be quite pleased to keep a book for registering sales of weed-killers and insecticides, with the name and address of purchasers. I have never heard of any accident or injury to life resulting from these preparations being sold by seedmen, and as most nursery and seedmen require to use them themselves, they are the better able to advise and warn others how to take care of and use them. *Stet Veritas.*

What could farmers give to our markets better than is now ordinarily seen in the shape of orchard standard trees, fruit of very moderate quality, ill assorted, and as indifferently packed? It does not at all follow that because a man may have the use of broad acres, and can afford to purchase and plant trees, that he becomes at once a capable fruit grower. If only so much of knowledge and of capacity were needed, we might have been all this time holding our own against the world. Even the old-time and practised market gardener is yet a long way off from realising one's ideal of a modern fruit grower. Some men who have planted within the past twenty years have better realised the needs of the time, and have planted dwarf bush and pyramid trees, and cultivated them well, growing only the most desirable varieties, and handling and packing the fruits with all possible care and integrity. These men can hold their own—but relatively how few they are. We have but to look at the thousands of acres of old standard trees, largely of indifferent varieties, growing within twenty miles of London, to see what poor conceptions exist as to fruit culture; indeed, it is not culture at all. Better far that most of these old and fast-exhausting trees were cut down and burnt, the ground being cropped with

vegetables, and for every one cut down a dozen of dwarfs of the finest varieties for market sale planted on fresh soil that has been specially prepared for them. The farmer may be encouraged to plant fruit trees on soil that is best suited for them, but most certainly if he plants, it will be where the ground has been inefficiently prepared. It seems to be impossible to make the ordinary farmer realise the immense importance in fruit culture of having the soil first deeply worked. That, indeed, is the very foundation of success. What can be hoped for or looked for when trees are planted on ground not worked more than from 10 inches to 12 inches? It is absurd in such case to look for success. Many of the ordinary class of market-growers, even though specifically market gardeners, are very little in advance of the farmer in relation to appreciation of trenching ground for anything, much less for trees; but this trenching, or its absence, constitutes the very foundation of success or failure. Then comes the selection of trees and varieties. If wisdom governs the planting, not more of Apples than some half-dozen

Currants, &c., under standard trees, where these are growing; still, the best results on bushes are obtained where each kind is grown alone and in the open. Mr. Mouro, in a recent remarkable paper read before the Horticultural Club on Fruit, asked, what would our home growers think of wrapping their fruit in tissue paper, as the foreigner does Oranges, sold here at 2s. per bushel? Is the British farmer likely to do that to his Apples and Pears? Not very probable, especially now he grows so much of mere rubbish. But it will have to be done presently, and our home growers will find that it will pay well to utilise the deft fingers of girls to wrap their best fruit in soft paper ere sending to market. Pity it is that Mr. Mouro's paper should not be read and studied all over the kingdom, and especially where fruit, such as it is, is now grown. What an immense deal has to be done ere we, as a nation, can rise to the height of the occasion. A. D.

THE ROYAL HORTICULTURAL SOCIETY.—Somewhere about 2700 Fellows of the Royal Horticultural

much valuable work, on legitimate lines, from a horticultural point of view, is being steadily carried out; and under the new superintendent with, as is stated in the report, "a perfectly free hand at Chiswick;" and, let us add, no "special committee" to sit in secret upon him! we may anticipate something fresh, if not sensational, in the next annual report of the Council. Along with the "Arrangements for 1896," which seem to be all "cut and dry," we have sent to us several documents, all of which, doubtless, are necessary for the well-being and the management of the society; but one of them, headed "Balloting List for Council," is a bit of a puzzle! Three names are printed upon it as those of the "members vacating;" and beneath these the names of three other "Fellows" are given, as being recommended by other members of the Council (a list of whom is affixed to each of the six names) "to fill the above-mentioned vacancies." Very good! and "mindful" of these members of the Council; but what is the use of sending this balloting-list to 2700, more or fewer, Fellows of the Society unless they are distinctly informed how they are to proceed in filling up the form in the manner they wish, and what the effect of duly filling or marking it would be? A column is headed "Voters' Marks;" and a note on the other side of the form lucidly informs us—"Every Fellow desirous of voting must make a cross (X) in the space adjoining the name of the Fellow he wishes to vacate office, and also against those he wishes to fill the vacancies." We are also duly referred, in a single line, to Bye-laws 65 and 84, to the operation of which we must imagine the retirements from the Council are due; but no quotation or a single word of explanation is given. Surely the Council of the Society does not expect every Fellow to carry in his pocket a copy of the Laws and Bye-laws of the Society? Neither is any information as to whom, where, and when this balloting-list is to be sent—supposing we do fill it up to our own mind! True enough, the date of the election is at the top of the form, and "please turn over" at the bottom on both sides; but these items of information, however necessary, are totally inadequate. Evidently there is a screw loose somewhere, if the Council really expects the Fellows to clearly understand the nature of their duties, in properly filling up, and returning in due time, this vague balloting-list. Would the Council also favour us, by giving some more definite information about the candidates for office whom they have nominated? than the bald "name and surname," inserted in this balloting-list. The three retiring Members of the Council are well-known names among horticulturalists, the first, as a generous patron of horticulture; the second, as a gardener, than whom none stands higher in the esteem of his fellows at the present day; and the third, as the head of a widely-known horticultural firm; and we may say each a representative of their class, and whose qualifications none will care to dispute. How stands it with their proposed successors, whose names are not found in any horticultural directory? With a tolerably wide knowledge of horticulturalists and of the Fellows of the Society, I fail to call to mind the services rendered to practical horticulture that specially qualifies either of those, no doubt, estimable gentlemen for the office into which the Council wishes to instal him, and expects to receive the approval of the Fellows for doing so! The first-named is a clergyman in a rural district of Hampshire, and also a member of the Scientific Committee; the second bears a name well-known in commercial business; and the third is an eminent scientist, and also a member of the Scientific Committee. Outside the realm of horticulture, we are not concerned, but it is really too much to ask the Fellows of the Royal Horticultural Society to place their confidence in so many unknown councillors at one time. What has become of all the leading men in the horticultural world in and around London, or within a radius of fifty miles? Have they just cause for holding back from accepting office? seeing that the Council, if it has ever asked them, cannot get a single one to accept a nomination for office. Is this the result of the great changes for the better which we have been led to expect? The timely warning you gave on p. 80 of last week's *Gardeners' Chronicle* is certainly needed in the present emergency, and should rouse up the Fellows of the society to a sense of their duty, and a firm determination to carry out that duty. The time is short between now and the 11th of February, but if the horticultural Fellows will only enter into the matter

FIG. 19.—APPLE LOAB (WINDLIP) (WATKINS).

(Shown by Mr. Watkins, Pomona Farm, Hereford, at the Royal Horticultural Society, on January 14, 1896.)

sorts will be planted, or at least not more of kitchen varieties. Of these from 500 to 1000 trees each variety should be put out, and at first comparatively close together. If in three or four years growth be strong, as probably it will, rather than the bare pruning, let all the trees be lifted and replanted at once, much more thinly, say at from 9 to 10 feet apart at least, the surplus going to plant other fresh ground. That thinning and replanting will be of inestimable service to the trees, as all gardeners know, will perhaps save the need of root-pruning for all time, will cause them to become more fruitful, and aided by frequent mulchings of manure and some artificial manures, their power to produce splendid crops may be prolonged some fifteen or sixteen years. Such a plantation as this would give the finest fruit from the best varieties Great Britain can produce. But the fruit grower on modern lines, and none other now are desirable, should plant more or less every year. There should be no cessation in planting; and when the trees become aged or show evidences of wearing out, there should be no hesitation in destroying. I would not favour mixed planting, such as standard trees with dwarfs, or Pears, Plums, bush fruits, &c., intermixed. Let each major fruit have its own area, and if wanted, plant bush fruits, Gooseberries,

tural Society, resident in the United Kingdom, have received within the past week copies of the "Report of the Council for the year 1895-6" and the "Arrangements for the year 1896." The Report is decidedly interesting, as much as for what it omits concerning the Chiswick imbroglio as for what it reports, in a somewhat gingerly fashion, upon that important topic, to all concerned in the welfare of the Society and the healthy progress of horticulture. In the meantime, the elicitation of "the truth, the whole truth, and nothing but the truth," about the dismissal, or, as the Report says, "retirement" of the Garden Superintendent in his prime, may be left to Mr. Smees and the hosts of other fair-minded Fellows of the Society, who, if they are allowed the opportunity, will undoubtedly support him in demanding a full explanation of the whole proceedings in this notorious case. Mr. Smees stated his plea in a perfectly straightforward manner in your columns of September 21 last, and no public opportunity has yet been given him to elicit the truth. It behoves all the Fellows who can attend the annual general meeting on February 11 to be present, and to watch the case closely, so that fair play may be given, and the full truth of the matter brought clearly out. The other "important work" of the society, as reported, is a fair average record, and shows that

with the spirit and enthusiasm its great importance deserves, they can elect as councillors the best men who are eligible and available. Far better to face the difficulty at once than to hang back and lose confidence in the Society, or become careleas as to its future usefulness and continued prosperity. *A Horticultural Fellow of the Royal Horticultural Society, January 20, 1896.*

**FRUIT SUPPLY OF COVENT GARDEN.**—In reply to "R. M., Newbury," in your issue of the 18th inst., I would refer him to my paper on "Grading and Packing Fruit for Market," given at the Crystal Palace show, September, 1894, and fully reported in your following issue; and to further illustrate my theory that Apples, at any rate, should be marketed in non-chargeable boxes, I give the following figures showing expenses each way; and when I state that fruit carefully packed and packed in this way will make from 10 to 25 per cent. more than in bushel-baskets, with the result that every fruit reaches the consumer's table in perfect condition, instead of there being a considerable proportion too much damaged to ever reach the consumer at all, I think there is little more to be said:—

**EXPENSES ON APPLES PER BUSHEL.**

Boxes not charged.		Bushels Bought by Salesmen.	
s.	d.	s.	d.
Cost of box	0 4	Carriage of empty, to grower	0 1
Carriage, 25 per cent.	0 6	Carriage, full	0 8
Less than bushels, say 0	6	Toll	0 0½
Toll	0 0½	Commission	0 0 3
Commission	0 0 3	Loan of basket	0 0 3
Paper	0 0 2	Sticks, &c.	0 0 1
		Return of empty, to sale-man, from customer	0 0 1
	1 3½	If sold to go on rail, extra carriage	0 2
Less value of box to retailer (at least)	0 1		
	1 2½		1 7½

Showing a clear saving of 5d. per bushel, besides running no risks of loss of crop while waiting for baskets, and enabling the grower to be independent of any particular market or salesman, to send his goods wherever he chooses, and earn a reputation by branding his name upon all cases—a thing impossible while sent in the same kind of packages as employed by hundreds of other growers, many of whom pack unfairly, and thus damage the sale of the whole. *Geo. Monro.*

**THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.**—I became a member of this Institution in the year 1868, and have continued my membership till the present time, and the records will prove that I have not been an idle one. The few remarks I have to make are in no carping spirit. I hate carpers, those self-important people one meets with every day, who will almost tell you that had they lived "in the beginning," when the heavens and earth were created, they would have made a better job of it. My only motive is for the benefit of this excellent Institution, which has done such good work in the past, which let us hope will do even more good in the future. Before this can be done, I feel sure that an important change will have to be made in one particular, and member or members, however influential, prevented from combining together to inflict a gross injustice upon subscribing members. On many occasions when I have asked gardeners to become subscribers, the reply has been, "What is the use? If I should ever require the help of the Institution, and am unable to secure a lot of influential support, I should have no chance whatever." I am bound to admit that this is too true, and therefore one feels hampered in one's efforts. Let the following rule be adopted, "That none but subscribers, or those who have been subscribers in the past, be allowed to be nominated as pensioners." Unless this, or some similar plan is adopted, I, for one, cannot ask anyone to support the Institution; the present system which permits any member to nominate a candidate who has never subscribed a shilling, over the heads of those who may have practiced self-denial for years to pay their subscriptions, is unsound in principle, hostile to the purposes for which the Association was formed, and totally opposed to its prosperity. *Bruce Findlay, Manchester, Jan. 20.*

**ISLES OF SCILLY FLOWER HARVEST.**—The flower season of the Isles of Scilly has commenced in good earnest, not only from the forcing-houses, but from outdoors. One grower alone sent off on the 21st, 4000 bunches of Soleil d'Or, or 48,000 spikes; the flowers are very fine, some of the spikes containing from eight to ten tips. The quantity as

well as the quality of Narcissus this year are excellent; last year Soleil d'Or was a failure, large patches never showed a bloom, but this season they are making up for it. Many other varieties are being sent to market, such as Obvallarie, Telamoonius plenus, Irish King, Henry Irving, Scilly White, Gloriosa, and fulgens. All other varieties are in a very forward state. The weather is more like that of spring than winter, even Roses out-of-doors have their buds almost fit for cutting. *J. C. Tonkin, St. Marys.*

**GARDENERS AND STEAM-ENGINES.**—I suppose that it is the lot of all men to experience at times keen disappointment. Whether or not such disappointment leaves us better or worse depends upon that which we wanted to get or to retain being good or bad. However this may be, most of us love a garden as the place where "peace and beauty reigned," and as one of the out-of-doors places where we can forget about commercial enterprises and the snorting steam monsters and other blinding oglinesses which we are told our age of keen competition makes necessary. We are not all versed in political economy, or the laws of necessity and the way of supplying them, but we never thought these inventors and manufacturers anxious to be rich would find it necessary to invade our gardens. Yet such would appear to be the case, of which I have just had unmistakable proof. Only last week, I was told with a solemnity which implied unquestionable truth, that a certain Town Council by whom I have been engaged for several years in laying-out at immense cost to the rate-payers, a quiet retreat in the form of a public park, had actually inspected and approved of a steam lawn-mower and roller which, if really brought into operation, will unquestionably destroy that very repose it has been my chief endeavour to create. I was, however, in hopes that this was a solitary instance of that contrariness which does at times, seize upon and affect the conduct of ordinarily perfectly sane persons. Not so, however, for on returning home on Friday last, I obtained a copy of the *Gardeners' Chronicle*, when to my surprise I saw a note from a gardener who with a conviction that would do justice to a better cause, urged the adoption of some form of motor, i.e., steam or other power, to drive lawn-mowers and garden-rollers; and to finish the day, amongst my letters I found one from a firm who are asking gardeners to acquiesce in their own destruction, soliciting my influence to obtain orders for them—for which service, of course, they would pay me handsomely. Now gardeners, allow me to ask you a pertinent question. Are you wishful to retain your standing as garden craftsmen, or are you going to reduce yourselves to the position of tenders of steam-engines? Remember, that in matters purely commercial every approved appliance may be necessary if competitors are to be successfully combated; but in a garden no such excuse can hold good, and if you allow these things to invade the peaceful domain of which you are the guardians, you will have done an irreparable injury to one of the purest enjoyments of this country which it ought to be your duty to defend, viz., the enjoyment which comes from a quiet English garden. *Thomas H. Mauson, Garden Architect, Wenderholme, Windermere, Jan. 17.*

**FICKLENESS OF PEARS.**—Seeing Mr. Coomber's note in the *Gardeners' Chronicle* (p. 56) on the fickleness of Pears, and the effect the hot weather of last summer had upon the flavour of some late varieties, and also the marked difference in the same varieties on walls of different aspects, I am induced to give my experience of some varieties, beginning with Bauré Rance, which, although fit for dessert in ordinary seasons, was much better flavoured this season, and the fruits are excellent at the present time. I find those grown on a west wall are the best. Winter Nelie and Ne Plus Meuris from a south wall were also good, but they ripened much earlier, and were fit for consumption in the month of November. Glout Moisean and Bauré Diel were better flavoured than usual. Easter Bauré grown on trees on a south wall did not ripen satisfactorily, but became mealy—yet it is a Pear which ordinarily does well with us. The best fruits of Marie Louise, as regards size and flavour, came from a tree growing against a north wall, being much finer than those from south or west. Some varieties of Pears on walls facing south or south-west were not so good, owing probably to the soil getting dry, as I noticed in the early part of the summer some were at a standstill, and did not appear to swell away as they should. *F. Q. C., Devon.*

**EARLY FLOWERING OF A RHODODENDRON.**—In calling on the 18th inst. at Merton Lodge, Chiswick, the residence of Mrs. Lloyd, I was very agreeably surprised to see in the shrubbery a young Rhododendron-bush in full bloom, carrying good trusses of red flowers. [Probably, *R. Nobilissimum* × *En*.] It bloomed in the usual way last spring or early summer, being one of others purchased at Lee's Ealing Nursery, in the previous autumn. I suppose the recent mild weather is the cause of this precocity. D. served interest attaches to the old garden, which is well managed by the gardener, Mr. John Addison, in that some of the fruit trees there in which he takes great pride and interest, were purchased from the neighbouring Royal Horticultural Society's gardens, on the reduction of the grounds in 1870. Many a good old-fashioned hardy herbaceous plant from the same source gives the borders here beauty and interest in its season, thus associating the Society's old historic garden with present day matters. *J. B.*

**DENDROBIUM WARDIANUM.**—I am aware of the difficulty experienced in many places of keeping *Dendrobium Wardianum* from deteriorating, even by gardeners experienced in the cultivation of Orchids. The excellent contributor to your columns of the note on this species in last week's issue will be pleased to know that I have at present more than one hundred plants of *D. Wardianum*, which were imported fifteen years ago, which are doing well, making good pseudo-bulbs 3 feet long, and when in flower they make a display not readily forgotten. *James Hebdon, Welham Hall, Bedford.*

**THE CERTIFICATES GIVEN BY THE NATIONAL DAHLIA SOCIETY.**—A critic like Mr. John Pope, who complains "that many First-class and other Certificates were awarded to worthless objects at the National Dahlia show held at the Crystal Palace last year," should, in justice to those who made the awards, be a little more explicit. While Mr. John Pope has a perfect right to express his individual opinion, I hesitate to accept his *ipse dixit* in preference to the opinion of the jury of experts who made the awards of the few Certificates granted on that occasion. A competent jury, representing all classes of Dahlia cultivators and exhibitors, generally eight or nine in number, takes cognizance of the new varieties, and awards Certificates of Merit to such as it deems worthy. I have made a careful reference to my notes of new Cactus varieties at the last Crystal Palace Dahlia Show, and unless I am greatly mistaken, only one Certificate of Merit was awarded to a Cactus variety, namely, Messrs. J. Cheal & Sons' Mrs. Wilson Noble, a very bright salmon-red, of the true Cactus type, which was shown in fine condition. I had two or three opportunities of seeing this variety growing last summer, and I have no hesitation in stating that that in point of habit—in the very essential feature of throwing its flowers well above the foliage, and in its freedom of bloom—it shows a decided advance on any other. A like award was made to a "decorative" variety, Willis Batchelor, bright pale scarlet, with white flame and tip to the petals, distinct in character, and decidedly promising. Mr. Pope states that "many First-class and other Certificates were awarded to worthless objects." Will he be good enough to name them? The very varieties he names with so much approval were all certificated by the National Dahlia Society in the past. *R. Dean.*

## THE POLYANTHUS.

The laced section has been so unsatisfactory during the last few years that the Auricula and Primula Society decided to omit it from their schedule for the ensuing year. Nevertheless, they are excellently cultivated in northern gardens, and these fine old favourites are not yet surpassed in their peculiar beauty. Some twenty years ago the Rev. F. D. Horner, at Kirkby Malzeard, had a splendid collection, which he kept in robust health. On my mentioning to Mr. Horner my difficulty in keeping the leaves of my plants free from red-spider, he, to my surprise, made answer that this insect gave him no trouble; in fact, plants that came to him with red-spider on the leaves speedily recovered when planted out in his garden; the pest could not live in the cool moist Yorkshire uplands, where the climate is just suited to the Polyanthus. Pity it is

that some florist in those districts does not take up the culture of this fine plant, and produce seedlings from the old varieties like George IV., Lancer, Cheshire Favourite, Exile, &c.

The fancy Polyanthuses have not yet been placed amongst the florists' flowers, but for this no adequate reason can be given, as the colours are now very beautiful, and the form of the flowers makes them admirable, fulfilling every property of a florist's bloom; indeed, many of them are superior in form to the best of the laced varieties, even the beautifully-formed George IV. They do best in the open garden, and if intended to be shown in flower-pots or boxes, they may be taken up from the open ground when in full flower; the plants do not suffer in the least. *J. Douglas.*

## SOCIETIES.

### BIRKENHEAD AND DISTRICT GARDENERS' IMPROVEMENT ASSOCIATION.

JANUARY 8.—The gardeners of Birkenhead and surrounding districts held their third annual *soiree* in the Music Hall, presided over by Mr. J. Gamlin, T.C., who was supported by Mr. J. Smith, of Palm Grove Nursery. Over 100 gardeners, with their wives and daughters, were present.

Too over, the Secretary of the Gardeners' Mutual Improvement Association (Mr. T. D. Smith) gave an interesting *re sume* of the work done during the past year in connection with gardening matters in the district. During the eleven months of its existence over 120 gardeners had been enrolled as members; a permanent meeting-room had been secured in the Y.M.C.A., where fortnightly meetings had been held for the discussion of matters horticultural, both practical and scientific; a comfortably furnished reading room had been provided at 13, Belmont, Oxton Road, and which was opened every evening free to all members, who had the use of all the leading publications on gardening matters, as well as of the Liverpool and Birkenhead papers. On Tuesday evenings a Botany Class was held; and the latest addition was an annual *soiree* for the benefit of members of the association only. The question now occupying the attention of the committee was that of a good library of the best standard works on matters horticultural, and when this object had been obtained, the Birkenhead association would be on an equal footing with any such association in Great Britain, and one that any gardener might be proud to be a member of. The association had up to the present been most successful in every way, and been fortunate enough to secure good financial assistance from the leading employers of gardeners in and around Birkenhead. The Secretary announced the receipt of several donations, amounting to £3 17s. 6d. The chairman next addressed those present, and congratulated the members on the success which had attended their efforts.

### DEVON AND EXETER GARDENERS' ASSOCIATION.

JANUARY 15.—The opening meeting of the spring session was held on the above date, when the Hon. Secretary (Mr. Hope) read a paper contributed by Mr. Alfred Gutram, of Messrs. Sutton & Sons, on "The Progress of Horticulture in the United States." As the paper was read in 1894 before the members of another society, the details have already been noticed in the gardening press. A good and useful discussion followed.

It was pointed out as affecting competition between fruit-growers on this side, and those on the other side of the Atlantic, that, while a barrel of Applescost 2s. 3d. for carriage between Exeter and Covent Garden, the charge from New York and Liverpool to Covent Garden was 1s. 6d. And while good orchard land in England had to be rented on lease at a cost of £3 to £4 per acre, the same quality of land could be bought outright for the same amount in many of the States. It was pointed out, too, that the United States Government had established experimental stations in many parts of the country where scientific trials were carried out which were of great value to horticulture and agriculture, and in this way helped these industries. Regarding introductions from America, Mr. Hope drew attention to the assertion made some time ago that Potatoes introduced from America to England retained their purity of stock and special features of excellence, showing it the first season of their being planted; while Potatoes of British origin, such as Champions, Regents, Magnum Bonums, and others, took two or three years to get acclimatised in the States and show their true character. Why is this? It was stated in the discussion that while horticulture in America had forged ahead, the pioneers and chief men in the craft there were Britishers. It was also a matter for congratulation in this country that the horticultural and floral necessities one reads of as being popular in America are practically unknown in this country. A hearty vote of thanks was passed to Mr. GUTRAM for his paper, and to Mr. POWELL, of Powderham Gardens, for presiding.

### EALING GARDENERS' ASSOCIATION.

At a recent meeting of this flourishing body of gardeners and amateurs, numbering between eighty and ninety members, Mr. John Barry, Chiswick, gave an interesting paper, entitled "Leaves Gathered Here and There."

The Great International Horticultural Exhibition of 1886 (amongst many other gardening topics) was referred to at some length, the decadence in specimen-plant culture since that famous horticultural gathering, being called attention to, and allusion directed to some of the specimen growers of that period, as Baines, Cole, Rhodes, Frazer, and many others. Local significance attached to the very successful part taken therein by the famous old local firm of Messrs. CHARLES LEE & SON.

Regarding local horticultural matters, the historical Chiswick Gardens of the Royal Horticultural Society were alluded to, suggestions being thrown out (with the laudable view of further developing and popularising the gardens for the benefit of the craft) that the Council should, in the future, afford facilities to young gardeners and others (to whom for many reasons it would be difficult to undergo a regular training course there) for witnessing, at stated times, the various cultural operations, such as the pruning of the society's fine typical collection of fruit trees, the influence of stock on scion, as to which most interesting experiments have been carried out at Chiswick. An insight, too, as to the various and valuable trials of new flowers, vegetables, &c., could not fail to furnish lessons of practical utility. Popular but not too lengthy lectures at Chiswick by competent men on the occasion of such visits by gardeners, &c., to practically illustrate matters would, it was thought, be of much benefit.

The subject of "Horticulture in the Hospital" was dealt with, this title being suggested by the good work carried on for the last four or five years by the Forest Gate Chrysanthemum Society, in allotting yearly a good sum to the West Ham Hospital as the proceeds of the Society's exhibitions. As being analogous to these praiseworthy efforts by the gardeners and amateurs of West Ham, attention was directed to the matter of concerts, &c., in aid of the Gardeners' Orphan Fund, and in which the Ealing gardeners rendered very substantial and much appreciated assistance in the past. As it claims upon the Fund grow yearly, without a corresponding increase of subscriptions to meet such urgent claims, the members present were urgently asked to take up again the matter of concerts.

In Chiswick (the headquarters of the Fund), the concert, which had been annually a great financial success, had been abandoned. Chiswick gardeners, &c., were, however, urged not to slacken in such truly good efforts.

A very good discussion ensued upon the various points of interest raised in the paper, at the conclusion of which a vote of thanks was unanimously accorded to Mr. Barry.

### HORTICULTURE AT CORNELL.

IN response to a request from the editor of *Science*, a brief outline of the purposes and methods of the work in horticulture at Cornell University is here given. This is the more willingly given because no full statement has been made of the capabilities which the subject of plant cultivation offers as a means of education. Horticulture is ordinarily taught in a technical or professional way, as a direct training for the intending farmer or gardener; but the purpose at Cornell has been much different, and it may be said broader than this. The subject seems to be capable of adding much to the value of a course of liberal academic training. In the older fields of education, such an outline as is here proposed might seem to be presumptuous, but in view of the novelty of the present subject, and the awakening interest in it, the sketch may perhaps be pardoned.

#### MATERIAL EQUIPMENT.

Before proceeding to the more important aspects of the subject, the reader may desire to know something of the facilities for the teaching of horticulture at Cornell. The material equipment is not large. It is exceeded in several other institutions in the country. If landscape gardening be added to the subject, it must be said that the equipment and facilities in this theme are practically nothing. The horticultural department comprises two diverse yet cognate lines of effort, the teaching and the research. The latter is commonly known, now that the experiment station idea is widespread, as experiment work. The same lands and glass-houses serve the two purposes. About ten acres of hilly and uneven land, upon which a miscellaneous but not large collection of fruits is growing, are allotted to the department. Something over an acre of this area is set aside for flower-growing. The glass-houses comprise eight structures, all connected, with an aggregate glass area of less than 9,000 square feet. These are plain, cheap structures, of which the total original cost, including heaters, was about 4,000 dollars. They are of the forcing-house type, and are adapted to the growing of the ordinary com-

mercial crops, such as winter Melons, Cucumbers, Tomatoes, Lettuce, Beans, Carnations, Chrysanthemums, and the like. There are no museum collections, except a very valuable and rapidly-growing herbarium of cultivated plants, in which there are now about 9,000 specimens. The small equipment is admirably supplemented in some directions by the orchards and gardens of the State, for it is the purpose to rely much upon the actual condition of horticulture in the Commonwealth as a basis of experiment and research. There are many experiments of importance which are now going forward on the farms of New York State; and whenever the investigation is of such a character that it can be conducted satisfactorily off the University premises, it is in some respects better for the allocation, because it spreads the work before a larger constituency, and ensures an accurate measure of its practical worth. But for teaching purposes these remarks will not apply.

#### THE MOTIVE OF INSTRUCTION.

The teaching of horticulture is of very recent origin. There are only two or three professorships of horticulture, uncombined with related subjects, in the whole country. The teaching of both agriculture and horticulture is commonly conceived of as a training for actual participation in these occupations. Most of the agricultural colleges are essentially training schools, at least so far as these subjects are concerned, and it is incontrovertible that they have exercised a powerful influence for the betterment of rural life. The Cornell teaching aims not so much to make farmers as to educate farmers' sons and daughters. In other words, its fundamental idea is to give those students who anticipate a rural life, such a breadth of training as will put them into touch and sympathy with the traditions of education, with all the larger movements of the day, and which shall enable them at the same time to understand the fundamental reasons of their own occupations. There is less attempt to apply the teaching upon the University farm than to instill a desire to master the underlying principles of agriculture. There is, therefore, no compulsory labour system any more than there is in the teaching of engineering or archaeology. The student can ill afford the time while at college to perform mere manual labour. He must give all his strength to the acquirement of knowledge, and even then he finds four years all too short in which to grasp the essential principles of the complicated rural pursuits. Teaching is done by class exercises and by laboratory work, as it is in all other scientific and technical subjects at the present day. If the student hears a lecture upon the philosophy of the rotation of crops, he also goes for a walk with the professor over the fields of the University-farm and of adjoining lands, and there observes the good and bad points of farm management. Or, if he hears a lecture upon winter Tomatoes, he also goes with the instructor, or alone, from day to day, and studies the Tomatoes as they grow under glass. The sum of education as it applies to rural affairs is comprised in the two words, judgment and management; and the student needs to have his mind opened by thinking upon economic, language, history, and general science quite as much as upon some of the particular subjects with which he is to deal in a more intimate way. The student should be a citizen before he is a farmer.

If the student once masters principles, he is able of his own resources to apply them. Yet many mature students come to us—some of them graduates—who have been taught the applications, the methods of doing farm work, but who are greatly ignorant of the fundamental principles upon which these applications rest. From all these remarks, it is apparent that much of the teaching does not lead directly, of itself, to better farm practice, but it aims to educate the student. Its effect upon the student is certainly salutary. As soon as he comes to learn that agricultural practice rests upon certain great laws, the operation and control of which are largely in his own hands, he becomes enthusiastic, and develops a deep and abiding love for rural life. This result is not obtained by the mere training-school. *Science.*

### TRADE NOTICE.

THE business of Mr. W. J. Watson, nurseryman and seedsmen, of Newcastle-on-Tyne, who died on the 7th inst., will in future be carried on under the same management, and with the same title, in the interests of the deceased's wife and family.

Obituary.

MR. JAMES COLE.—We regret to have to announce the death of Mr. James Cole, third son of the late Mr. Wm. Cole, of Joy Lane Nurseries, Withington, near Manchester. The deceased commenced his career as propagator under his father, at Withington, in 1854, where he remained until 1872. He then left England for America, where he acted as manager to Such, South Ambay, New Jersey, for many years. On his return to this country, he entered the service of Messrs. Ireland & Thompson, Edinburgh, as manager of the Craighleigh Nurseries. Leaving this post, he took up a similar one with the successors of the late John Standish, of Acot, where he remained about four years. From this place he proceeded to London, and joined the firm of John Laing & Son, where he remained until March, 1895. Failing health caused him to give up work, and on January 14, 1896, news was received of his death at the age of fifty-four years. He was interred at Wilmslow churchyard, Cheshire, last Monday.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Table with columns for DISTRICTS, TEMPERATURE (ACCUMULATED), RAINFALL, and BRIGHT SUN. Rows list districts 0 through 13 with corresponding weather data.

The districts indicated by number in the first column are the following— 0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W. 9, Ireland, N.; 10, Ireland, S. \* Channel Islands.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending January 18, is furnished from the Meteorological Office:—

"The weather was unsettled, with rain at times, during the earlier half of the period, but subsequently became fair over the greater part of the Kingdom. In the extreme west and north, however, the conditions continued unsettled throughout the week.

"The temperature was just equal to the mean in 'Scotland, N.,' but exceeded it considerably in all other districts, the excess ranging from 3° in 'Scotland, E.,' to 5° in 'Ireland,' and to 6° in the 'Midland Counties.' The highest of the maxima were recorded on the 17th, when they varied from 55° in the 'Midland Counties' and 'Ireland, S.,' to 51° in 'Scotland, N.' The lowest of the minima were registered during the early or middle part of the period, and ranged from

20° in 'Scotland, N. and E.,' to 32° in 'England, S.W.,' and 33° in 'Ireland, S.,' and to 38° in the 'Channel Islands.' "The rainfall greatly exceeded the mean in 'Scotland, N.,' and to a slight extent in 'Scotland, E.,' 'England, N.W.,' and 'Ireland, N.,' while in 'England, N.E.,' the fall just equalled the normal. In all other districts there was a deficit. "The bright sunshine was more prevalent generally than it has been of late, but was still less than the normal except in 'England, N.E.,' and 'N.W.' The percentage of the possible duration ranged from 23 in 'England, N.E.,' 21 in the 'Channel Islands,' and 18 in 'England, N.E.,' to 10 in 'England, S.,' and 'Ireland, S.,' and to 6 in 'Scotland, N.'"

MARKETS.

COVENT GARDEN, JANUARY 23.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. ED.]

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table listing prices for various plants in pots such as Adiantum, Aspidistra, Azalea, Chrysanthemums, Cyclamen, Dracaena, Erica, Evergreen Shrubs, Ferns, etc.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table listing prices for cut flowers such as Arums, Azaleas, Bouvardias, Carnations, Chrysanthemums, Eucharis, Gardenias, Hyacinths, Lilacs, Lilies, etc.

ORCHID-BLOOM IN VARIETY.

Table listing prices for orchid blooms in variety such as Apples, Apricots, Beans, Cauliflowers, Mushrooms, Cucumbers, Onions, etc.

VEGETABLES.—AVERAGE WHOLESALE PRICES.

Table listing prices for various vegetables such as Beans, Cauliflowers, Mushrooms, Cucumbers, Onions, etc.

POTATOS.

Trade remains very dull, and prices rule low. NEW POTATOS. Canary Island supply gradually increases in quantity. Myatt's from 3d. to 5d. per lb.; Magnums, 2d. to 3d. do.; Malta Kidney (few only), 12s. to 16s. per cwt. J. B. Thomas.

SEEDS.

LONDON, Jan. 22. — Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Foad, Borough, London, S.E., report to-day's market thinly attended, with but little

business doing. There is an abundant supply of Clover and Grass seeds at moderate rates. Values all round show this week no important alteration. For bird seeds, the sale is slow on former terms. The new Wisconsin Green Peas just arrived in London; being good boilers, handsome in appearance, and low in price, attract increasing attention. There is no change in either Mustard or Rape seed. Tares, both spring and winter, meet an improved inquiry. In linseed the tendency is upwards. Haricot Beans keep firm.

FRUITS AND VEGETABLES.

BOROUGH, Jan. 21.—Quotations:—Savoys, 3s. 6d. to 5s. per tally; Sprouts, 1s. to 1s. 6d. per sieve; Carrots, 2s. to 2s. 6d.; Turnips, 1s. 6d. to 2s. per dozen bundles; Onions, 2s. 9d. to 3s. 6d. per bag; Horseradish, 10d. to 1s. per bundle; Apples, 4s. to 6s. per bushel.

SPITALFIELDS, Jan. 21.—Quotations:—Savoys, 2s. to 3s. per tally; Bunch Greens, 1s. 6d. to 2s. per dozen; Sprouts, 1s. to 1s. 3d. per half sieve; do., 2s. 3d. per bushel; Lettuce, 1s. per dozen; Turnips, 1s. 6d. to 1s. 9d. per dozen bunches; Carrots, 1s. 9d. to 2s. per dozen; Rhubarb, 1s. to 1s. 3d. per dozen bundles; Celery, 10s. to 15s. per dozen bundles; Turnips, 2s. to 3s. per ton; Carrots, 22s. 6d. to 27s. 6d. do.; Parsnips, 35s. to 40s. do.; Lettuce, 20s. to 25s. do.; Apples, dessert, 4s. to 5s. per bushel; cooking, 3s. to 3s. 6d. do.

STRAFORD, Jan. 21.—Trade has been rather slow. There has been a large supply of vegetables, such as Greens, &c.; consequently, slow sale. Potatoes of good quality meet with a fair demand. Quotations:—Collards, 1s. 8d. to 2s. per tally; Savoys, 2s. to 3s. do.; Greens, 1s. to 1s. 6d. per bag; do., 1s. to 1s. 3d. per dozen bunches; Cauliflowers, 1s. 6d. to 2s. per dozen; do., 5s. to 7s. per tally; Carrots (household), 2s. to 30s. per ton; do., cattle feeding, 18s. to 24s. do.; Parsnips, 6d. to 12d. per score; Mangels, 12s. to 16s. per ton; Swedes, 13s. to 17s. do.; Onions, English, 90s. to 100s. do.; do., Dutch, 3s. to 3s. 6d. per bag do.; Bordeaux port, 5s. to 6s. per case; Apples, English cookers, 2s. 6d. to 4s. per bushel; do., American dessert, 2s. 6d. to 3s. 6d. per barrel; do., Nova Scotia, 12s. to 14s. do.; Scotch Kale, 6d. to 9d. per sieve; Beetroot, 6d. to 8d. per dozen; Horseradish, 1s. 1d. to 1s. 3d. per bundle; Parsley, 1 1/2d. to 2d. per bunch; Brussels Sprouts, 1s. to 1s. 3d. per half-sieve; Rhubarb, forced, 1s. to 1s. 6d. per dozen bundles; 8d. to 1s. per roll; White Turnips, 1s. 6d. to 2s. per bag.

FARRINGTON, Jan. 23.—Quotations:—Savoys, 4s. per tally; bunch Greens, 1s. 6d. per doz.; Sprouts, 1s. 3d. per half-bushel; French Beans, 6d. per lb.; Sea Kale, 1s. per punnet; Orly Kale, 1s. per bushel; Lettuce, 1s. 6d. per dozen; Turnips, 2s. per dozen bunches; Carrots, 3s. do.; Horseradish, 1s. 2d. per handle; Parsnips, 1s. per score; Parsley, 2s. per dozen bunches; Rhubarb, 1s. 3d. per dozen; Onions, 3s. 9d. per bag; Endive, 2s. per dozen; Lettuce, 1s. 6d. do.; Grapes, English, 1s. 6d. per pound; Apples, Wellingtons, 7s. per bushel; Blenheim, 5s. do.; Baldwins, 18s. per barrel; Greenings, 15s. do.; Newtown Pippins, 18s. do.

STOKE NEWINGTON, STAMFORD HILL, AND CLAPTON CHRYSANTHEMUM SOCIETY.—We are informed that the Secretary and Treasurer of this Society, Messrs. L. H. and S. CALVERT, have placed their resignation in the hands of the President of the Society.

ENQUIRY.

"He that questioneth much shall learn much."—BACON.

ORANGE GROVES AT SALCOMBE.—I am told that on the Devon or Cornwall coast there is an Orange grove, at a place called Salcombe, the fruit of which comes to perfection every year (?), the plants mentioned remaining in the open air the year round. Can any reader give information? J. B.

AGENT OF PAPER: R. S. T. South African Planter's Gazette. We are unable to discover this paper in "Sells" list. The Planter's Gazette and Export Journal is published by Keppel Jones, 32, Fenchurch Street, E.C.

BARKING VINES: A. D. B. Not desirable, unless the Vine are infested with insects, such as mealy-bug, red-spider, and thrips, and then merely the rough bark should be rubbed off.

BOOKS: W. W. S. The Amateur Orchid Cultivator's Guide Book, by H. A. Burberry, Highbury, Birminghamp.—H. D. You should obtain the paper On Prises, read before the Royal Horticultural Society on May 14, 1889. It is published as a pamphlet, and will be supplied on application to

the secretary of the Society, 117, Victoria Street, Westminster, London, S.W.—A. D. B. *The Tomato; its Culture and Uses*, by W. Iggulden, published at office of *Journal of Horticulture*, 171, Fleet Street.

CLIMBERS TO COVER AN OLD TREE: B. C. M. Clematises, such as *vitalba*, *flammula*, *montana*, *Jackmanni*, and many others. Other climbing plants to select from are *Virginian Creeper*, *Regner's Ivy*, *Menispermum canadense*, *Jasminum nudicaule*, *Honeysuckles* in variety, &c.

CELOYGYNE: A. B. *Celogyne cristata*, when well grown sometimes produces more than one spike to a pseudo-bulb.

FUNGUS: W. J. P. has sent us specimens of an Agaric which comes up on his Mushroom-beds as soon as they are fit for spawning, and wishes to know what is their name and influence. When they reached us there was nothing to be found but several naked stems, and a dark brown slimy fluid, which latter represented the dissolved "caps." In this condition the name is not to be guessed. Although so deliquescent, they are not a *Coprinus*, for the spores are elliptical, dark brown, not black, and about 12 by 7  $\mu$ . The strong odour resembled that of some *Hebelomas*, but the colour of the spores more like *Hypoholoma*. Each specimen wrapped separately in thin paper, and sent direct, might perhaps reach us sufficiently perfect for identification. M. C. C.

GARDEN STAFF: J. W. G. Without having seen the garden and house, and formed an idea of the sort of gardening pursued, we can merely roughly estimate the number of men at four, with one or two boys for the performance of light jobs. Gathering, packing, and taking produce to market, will entail much labour, that at first sight is unproductive.

GOOSEBERRY-WOOD DECAYED: W. G. The decay may be due to the lower part of the stem being attacked by a fungus, *Polyporus ribis*, or simply to old age. It would be advisable to dig below the roots in order to discover if any *Polyporus ribis* exists there.

INSECT ON ORCHIDS: C. P. The creatures found among the Orchids belong to the family of "spring-tails" (*Collembola*); they feed principally on decaying vegetable matter, and are not likely to cause damage. R. McL.

MICROSCOPES: J. P. We feel some difficulty in advising you, as we do not in the least know your capabilities or your requirements. You can get a sufficiently good student's microscope for £5 or £6, to which you can add if necessary, but you require training before you can use it to any advantage. You could get the training at a science school, if there is one near you.

NAMES OF FRUITS: J. Oliverson. 11, Lewis's Incomparable; 12, Golden Noble.—*Ficus*. 1, Cellini; 2, Emperor Alexander.—*Constant Reader*. 1, Blenheim Orange; 2, Cellini (?); 3, Tower of Glamis; 4, Fearn's Pippin; 6, Bedfordshire Foundling; Hollyberry not known by that name.—W. & J. B. 1, King of the Pippins; 3, Blenheim Orange; 4, Minshall Crab; 6, Dutch Codlin.

NAMES OF PLANTS: W. J. & Sons. The Daffodil sent is a form of *Narcissus telemonius plenus*. The trumpet-form often occurs, but never becomes fixed. Yours will probably be cut up another season like the rest of the flowers.—W. J. P. 1, *Schaueria calycotricha* (*Justicia flavicoma*, *J. calycotricha*, &c.); 2, Mistle-leaved Orange (*Citrus myrtifolia*).—S. P. D. 1, *Adiantum cuneatum mundulum*; 2, *Pteris longifolia*; 3, *Selaginella denticulata*; 4, *S. Mertensii*; 5, *Nephrolepis exaltata*; 6, *Davallia orata*.—G. N. *Calanthe veitchii* Turneri.—F. H. *Magnolia fuscata*—E. F. *Craesula cultrata*, *Bot. Mag.* t. 1940.—N. E. *Tusilago fragrans*.—Card. *Epidendrum polybulbo*.—W. H. S. 1, *Chimonanthus fragrans*; 2, *Oplismenus Burmanni variegatus*, commonly called in garden *Panicum variegatum*; 3, *Billbergia mutans*; 4, *Ardisia crenulata*.

ODONTOGLOSSUM CRISPUM: W. W. S. Do not be discouraged, Orchid culture presents no particular difficulties. The flower shoot was eaten at the base, probably by a predatory slug, and for these creatures you must be ever on the watch. It is a good plan to keep baits about the stages and on the pots for them: these may consist of hollowed halves of raw Potator, Carrots, &c., and examine these by candle-light as well as during the day.

POPLARS: *Robinia*. 1, 2. Poplars are very subject to die back, sometimes as a consequence of frost. The cracks caused by the frost allow of the access and germination of fungus-spores. A special fungus disease in Poplars has lately caused much destruction in Germany. 3, Sycamores; please send a bit of the var. 4, Yes; more bruising is caused by the *scabreur* than by the knife. Another time, please send your business letters to the publisher, and your questions to the editor.

ROMAN HYACINTHS: A. S. The bulbs seem to be healthy, but on cutting them open it is evident the flower-buds have never been formed, owing probably to climatal reasons. The bulbs will probably flower next year.

ROOTS OF PEACH: M. Mc. The root, that of the usual stock on which the Peach is worked, namely, some kind of wilding Plum, does not seem to be diseased, but rather to show a tendency to produce "suckers" from adventitious buds, which was plainly visible by the numerous swellings. This is universal in Plums, and a quite natural method of reproduction.

SEEDS FROM INDIA: W. W. *Sorghum vulgare*, Millet, a widely-distributed agricultural cereal, called variously *Dhurra*, *Darra*, *Dari*, &c.

VINE BORDER: S. May. The border is deep enough. The number of Vines in each house might be increased by two. The drainage is all right. The hot-water piping is sufficient, except perhaps for early forcing. You would do well to mix a large proportion of rather fibry loam and road-grit with the other ingredient, and less manure; in fact, it would be better to apply manure only as top-dressings and mulches. By all means keep "the boughs" out of the border, or you may have some injurious species of fungus spread through the soil; and if you can procure some thick sods, use these instead to keep the soil from getting into the drainage. Depend on liquid-manure and mulches, wherewith to feed the Vines. The border need not be made up all at once, but piecemeal, as the roots need space. The selection of varieties is a good one. Shake out the Vine-roots when planting them when at rest almost entirely, a nucleus may remain at the centre of the mass, and lay them out in straight radial directions, and at a variety of depths, those nearest the surface not being less than 4 inches deep. So as to encourage quick and good growth at the outset, some light, rich, slightly-sandy compost may be used about them, and for some distance beyond them, but no rank manure should touch the roots, and a slight mulch would do no harm if the soil of the border is light and porous, otherwise the more sunheat gets into the soil the better in this country. The slight shade afforded by a thin row of Sweet Peas, *Convolvulus*, or the like, does good in preventing a too rapid evaporation of moisture. Growing Vines may be planted in May. These should be grown on trays or box-lids, or any such-like contrivance, which measures about 2 feet square, the Vine-roots being covered with a mound of loamy soil. The plants should be got into growth, whether as cut-backs or canes left at half their length in the middle of the month of March, and grown on without undue coddling in a heated pit, without bottom-heat; affording water and manure-water also when the roots appear on the surface, syringing them twice daily, and otherwise treating them like Vines in pots. In May they may be pushed off the board into shallow holes made in the right positions in the border.

WEEVIL GRUBS IN STRAWBERRY POTS: X. Y. Z. A correspondent tells us that the simple immersion of the pot of soil in water for a few hours will bring the grubs to the surface. In certain stages of pot Strawberry growth, this course might be advisable, at others it would be likely to do much harm. It should not be adopted before the bloom is set, and a good head of leaves formed.

WHITE FLY ON TOMATO PLANTS: T. P. R. Use XL All Vaporiser as you suggest, there is nothing more certain in its action than this preparation, and it does not injure the most delicate vegetation.

# MESSRS. BELL'S BOTANICAL BOOKS.

## JOHNSON'S GARDENERS' DICTIONARY.

An Entirely New Edition, thoroughly Revised and Considerably Enlarged by  
**C. H. WRIGHT, F.R.M.S., & D. DEWAR,**  
*Curator of the Glasgow Botanic Gardens.*  
Complete in One Volume, Demy 8vo, cloth, 9s. net.

NOTE.—The First Edition of this work was published in 1846, and at once became recognized as the standard authority on the subject, a position which it has retained ever since. It has passed through numerous editions, but has not been completely revised since 1883, though Supplements have twice been added since that date. For this edition the whole book has been carefully revised from beginning to end, with considerable additions, and has in all respects been brought up to the present state of Horticultural knowledge.

"It is without doubt one of the most reliable and important Gardening Dictionaries that has ever been published; in fact, as a dictionary and guide for gardeners, amateur or professional, its equal is not to be found in Horticultural literature. When the eight parts are completed, it will form a marvellous digest of matters horticultural, and a standard work for the guidance of all interested in the art and science of gardening."  
—*Horticultural Times*.

## SOWERBY'S ENGLISH BOTANY,

Containing a Description and Life-size Drawing of every British Plant. Edited and brought up to the present standard of Scientific Knowledge by T. BOSWELL (late SYME), LL.D., F.L.S., &c. *Third Edition entirely revised.* With Descriptions of all the species by the Editor, assisted by N. E. BROWN, Twelve Vols. with 1937 Coloured Plates. £24 3s. in cloth; £26 11s. in half-morocco; £30 9s. in whole morocco. Wednesday, February 5.

## HEMEROCALLIS AURANTIACA MAJOR,

A Magnificent New Species,

ONE OF THE FINEST INTRODUCTIONS OF RECENT YEARS.

Large Importation of 900 Clumps, just received from Japan. By order of Messrs. Bunting & Sons, the entire shipment being offered.

The Plant is described and figured in the *Gardeners' Chronicle*, July 20, 1895, where, on p. 82 Professor BAKER states that it is the finest HEMEROCALLIS he has seen. It has also been figured in the *Gardeners' Magazine* and *Journal of Horticulture* for August 17 and August 16, 1895, respectively, and is most highly spoken of in every report. It received F.C. Certificate, Royal Hort. Soc., July 9, 1895, and also the Manchester Royal Botanical Society, July 24, 1895.

A Coloured Plate will be on view at the time of Sale.

Messrs. Bunting & Son were the first to introduce this valuable plant, receiving a few from Japan two years since, and the figure in the *Gardeners' Chronicle* was taken from a plant bloomed at their nurseries.

It is quite hardy and very vigorous, foliage deep green, flower spikes strong, bearing as many as twelve flowers in succession, 7 to 10 inches across, of a rich orange-yellow, quite distinct. The flowering period lasts from July to the end of August. It is in every way a most valuable acquisition.

N.B.—The Auctioneers beg to announce that they have seen some of the roots, they are very large and remarkably fresh, showing three or four crowns each, having also numerous tubers resembling strong Dahlia Roots after two years' growth.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on WEDNESDAY, February 5, at Twelve o'clock.

On view morning of Sale, and Catalogues had.

Thursday Next, February 6.

100 AZALEA INDICA and MOLLIS; 48 CAMELLIAS and PALMS from the Continent; 300 DWARF ROSES; STOVE and GREENHOUSE PLANTS.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on THURSDAY NEXT, February 6, at 12 o'clock.

On view morning of Sale, and Catalogues had.

Friday Next, February 7.

By order of Messrs. W. L. Lewis & Co., Southgate, N. IMPORTED ORCHIDS, including Cattleya citrina magnifica (from a fresh locality), Epidendrum vitellinum majus, the gem of the genus; Lælia Pinelli, the grand new Jugapatubiana type, &c.

Also, ESTABLISHED ORCHIDS, comprising Cattleya Mendellii in sheath; Cypridium Seedlings, Oncidium tigrinum superbum, and other first-class Orchids.

Also, 24 Sophronitis grandiflora, and other Orchids, in flower.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, February 7, at half-past 12 o'clock.

On view morning of Sale, and Catalogues had.

Friday Next, February 7.

SPECIAL SALE of HARDY PERENNIALS, EXHIBITION HOLLYHOCKS, PANSIES, IRIS, CYPRIPEDIUM SPECIATUM, LILiums in variety, ANEMONES, TYGRIDIAS, MONTERETIAS, BEGONIAS, GLOXINIAs, DAHLIAS, CLEMATIS, TEA and other ROSES, CARNATIONS (new and old varieties), PINKS, PHLOXES, Double and Single PEONIES, AMARYLLIS, &c.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, FEBRUARY 7, at 12 o'clock.

On view morning of Sale, and Catalogues had.

Friday Next, February 7, 1896.

By order of Mr. P. McArthur, The London Nurseries, Maida Vale, W.

The most marvellous introduction of the present age.

## THE BLUE CATTLEYA.

CATTLEYA QUARICOENSIS, in perfect condition, with fresh green leaves. Only 100 plants were found, and all will be offered for Public Sale, and any will be sold privately. My collector writes:—"I found this superb Cattleya at an altitude of 2500 feet. It flowers in March; the locality where found is most difficult and dangerous, owing to the vast number of venomous snakes. The flowers are enormous in size; the first four days they are celestial blue in colour, afterwards changing to a light rose (the colour of a La France Rose), and lasting three weeks in perfection. My guide and myself had to swim the enormous river with these plants tied to large trees, there being no peons or mules to be had. My life was in great danger yesterday. I have to hide in the forests during the day, and travel at night. I also seed you a grand lot of—"

CATTLEYA LABIATA PERCIVALLIANA AUTUMNALIS, NEW, found on a mountain at an altitude of 2300 feet. It is quite distinct from the ordinary variety, and has never been introduced into Europe before. This is the scarcest of all Cattleyas in Venezuela, and most difficult to get. I had to cut my way through woods that were almost inaccessible. This variety is the richest in colour I have ever found, and cannot be too strongly recommended. Many white ones are amongst them, and some extra choice varieties, viz., formosa, splendens, Harmsos, elegans, pallida, pinuela, superba, and bigaudensis." Dried flowers of both species will be exhibited at Sale.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, February 7, at half-past 12 o'clock.

On view morning of Sale, and Catalogues had.

TUESDAY NEXT, FEBRUARY 4.

BY ORDER OF

HUGH LOW &amp; CO.

Splendid Opportunity to Gentlemen at command.

TO BE SOLD, as a Going Concern, Goodwill free, of Old-Established FLORIST and MARKET NURSERY.—Glass nearly 20,000 feet, greater part recently erected; situated at well-known watering place; well stocked, and in thorough working-order; great and increasing demand for Cut Flowers, Cucumbers, Tomatos, and every kind of Market Produce in Plant Trade. Being a sound and genuine concern, it is well worth attention. Long lease, small ground rent. The Stock (which is clean and well-grown, being grown on for Autumn and Spring work) at low valuation. Price for Land, with all the Glass Erections and Pippings, £1,750. No Agents. Apply, OWNER, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

TO BE SOLD, a valuable old-established NURSERY and FLORIST BUSINESS. The Shop is situated in the best part of Lord Street. The Nurseries are a mile from town, and contain an acre and a half of land, leasehold 99 years from 1822. There is a good modern Dwelling-house attached, containing two Entertaining Rooms, and seven Bedrooms, &c. There are twelve Glasshouses, also heated Pits and Frames. The Nursery can be had with or without the Shop, and a considerable portion of money can be left on mortgage. This is a splendid opportunity, as the owner is retiring from business. For further particulars, apply—A. CAMPBELL, Nurseryman, Southport.

**Royal Gardeners' Orphan Fund.**  
**THE ANNUAL GENERAL MEETING** of the Subscribers to this Fund will be held at "Anderson's Hotel," Fleet Street, London, E.C., on **FRI DAY, February 21** next, for the purpose of receiving the Report of the Committee, and the Accounts for the past year; to appoint officers for the ensuing year, and to elect Ten Children to the benefits of the Fund. The Chair will be taken at 2 o'clock. The Poll will close at 4 o'clock, after which no Votes will be received. By Order,

A. F. BARRON, Hon. Sec., Chiswick, Jan. 18, 1896.  
 The voting papers have all been issued. Any subscriber not having received one, is requested to communicate with the Secretary.

## NEW FUCHSIAS FOR 1896.

**MR. WILLIAM BULL** has the pleasure to announce that he will send out at the end of April for the first time, the following TWELVE NEW FUCHSIAS. They are all magnificent varieties, and are offered at a low price for such Sterling Novelties.

**BELLONA**, short tube and completely reflexed sepals of a rosy-carmine colour; large white double corolla, suffused and veined rose-pink.

**CALLIOPE**, large double flower; corolla rich violet-purple, short tube and broad crimson sepals.

**CERES**, very short crimson tube and sepals, well reflexed, very full-spreading double corolla, pale blush, thickly marmorated and veined with deep pink. Very distinct.

**DORIS**, short tube and large broad coral-red sepals horizontally extended; immense double corolla, petals reddish-purple, margins shaded with metallic blue.

**FORTUNA**, short tube and broad reflexed crimson-red sepals; large double white corolla, heavily shaded rose, and marked crimson at the base.

**IRENE**, short red tube and sepals, well reflexed; single reddish-violet corolla marked with crimson at base and well extended.

**IRIS**, short tube and broad carmine-crimson sepals; large double white corolla, shaded with rose, and flaked rose-pink.

**LEDA**, short tube and very broad reddish-crimson sepals, irregularly reflexed; corolla bluish-violet veined with crimson and much expanded.

**METIS**, short dark-rose tube and sepals, the latter well reflexed; double white corolla marked deep rose at base.

**ROSALIE**, short bright crimson tube and sepals, horizontally extended; large double white corolla, veined at the base with cerise-pink.

**SERENA**, very short rosy-pink tube, sepals completely reflexed; immense double spreading corolla, blush-rose veined with deep pink.

**THALIA**, short tube and broad coral-crimson sepals, well reflexed; semi-double white corolla, the petals well expanded, suffused with rose, and veined crimson at the base.

Price 5s. each. The collection of twelve for Two Guineaes. **WILLIAM BULL, F.L.S.**, Establishment for New and Rare Plants, 536, King's Road, Chelsea, London, S.W.

## CHRYSANTHEMUMS.

### MAGNIFICENT NOVELTIES

which no "up to date" Grower can afford to miss.

**PRIDE OF EXMOUTH**.—An immense bloom of superb form; white, slightly frosted cherry-pink. Considered by many who have seen it to be the finest novelty of the year. 7s. 6d.

**MISS MARY GODFREY**.—Of the largest size; a distinct and lovely pink, being that of the Peach bloom. 7s. 6d.

**ARONA (Briscoe-Ironside)**.—In size and form similar to Col. Smith, but of richer colour and of much better substance. 7s. 6d.

**MRS. HUME-LONG**.—Another monster bloom, yet free from coarseness. 7s. 6d.

**MRS. BRISCOE-IRONSIDE**.—I have purchased a portion of the stock of this from Mr. B.-I. A lovely variety undoubtedly. 6s.

**MR. W. LAYCOCK**.—Large blooms; clear straw colour. Much admired by all who have seen it.

These do not by any means exhaust my LIST of STERLING NOVELTIES for 1896. All are fully described, together with the best from all other raisers, independent of source, in

THE MOST RELIABLE CATALOGUE  
PUBLISHED, POST FREE.

**W. J. GODFREY,**  
EXMOUTH, DEVON.

### RHODODENDRONS.

Well furnished and well huddled, with from seven to twenty buds, consisting entirely of the reliable hardy kinds; the MAJORITY BEING ON THEIR OWN ROOTS, they are without doubt the best Rhododendrons in commerce.

### HARDY AZALEAS.

All the most beautiful varieties, varying in height from 1 1/2 to 3 feet; the plants are covered with buds.

**ANTHONY WATERER,**

Knapp Hill Nursery, Woking, Surrey.

**CHRYSANTHEMUMS.**

We have great pleasure in announcing that we have received from H. BRISCOE-IRONSIDE, Esq., a stock of his grand new Japanese—

MRS. BRISCOE-IRONSIDE.

The name will show the raiser's opinion of this variety, which he considers the best thing he has ever produced; it has been awarded First-class Certificates every time exhibited (unanimous votes each time), and is, without doubt, the most beautiful Jap. yet seen. The colour is most lovely, a delicate transparent flesh tint, and the bloom large without a trace of coarseness. Every grower, whether for exhibition or personal pleasure, should secure at once. Plants, 6s. each.

J. R. PEARSON & SONS, CHILWELL NURSERIES, NOTTS.

# JAMES VEITCH & SONS

Have much pleasure in introducing amongst their Novelties for the Season, a superb

# NEW TOMATO

"ALL THE YEAR ROUND."

First-class Certificate, Royal Horticultural Society, April 23, 1895.

A very superior variety raised by Mr. Farr, gardener to A. Peare, Esq., Spring Grove House, Isleworth. The fruit is rather below the average size, bright red, and of a Plum shape, very solid, and of high quality. It is abundantly prolific, producing clusters at every joint. Ripe fruit can be obtained all through the year by making two sowings, one in February, and again in August. The plant is of good constitution, with strong vigorous growth, and is remarkable for its continuous bearing, both under glass and in the open ground.

Per Packet, 2s. 6d.

A CATALOGUE of all other NOVELTIES and SPECIALTIES Post Free on application to—

# JAMES VEITCH & SONS

4 to 6 ft. high, by 5 ft. wide; splendid specimens,

## PINUS AUSTRIACA,

4 to 12 feet, well removed.

## SCARLET HORSE-CHESTNUTS,

10 to 18 feet; splendid trees, safe to move.

## PAUL'S SCARLET THORNS,

And many other sorts, 8 to 12 feet.

## PURPLE BEECH,

16 to 18 feet; splendid trees.

## TRUE SILVER BIRCH,

Bark white as snow; 12 to 20 feet.

## RHODODENDRONS,

Named sorts and others; 1 to 5 feet.

## CAMELLIAS,

1 to 10 feet; in fine health and bloom.

## CLEMATIS,

Fifty Finest Varieties. Strong Plants.

## A LARGE GENERAL NURSERY STOCK

ALWAYS ON SALE.

Catalogues, Prices, and Particulars Free by Post.

## SWINTON PARK.

OF all the English counties, Yorkshire, as every one knows, stands forth as the largest and most varied; fewer people perhaps realise that it extends—not quite, as the Irishman said, "from the Atlantic on one side, to the Pacific on the other," but from the North Sea on the east side, to within ten miles of the Irish Sea on the west. The climate of this great county being variable and in parts inclined to be rigorous, many shrubs and flowers, suited to perfection in the comparatively mild climate of the south-western counties, thrive only imperfectly in most parts of Yorkshire.

Here and there, however, among the dales, these adverse circumstances are apt to be absent or materially modified, so that many plants which are liable to be severely cut by the hard winters on the cold soil of the plains, may here be induced to thrive. Very considerable difference in temperature is often observable even in short distances, as, for instance, between Harrogate and Pateley Bridge (fourteen miles), where, at the latter place, the mean temperature will probably average several degrees less. Another circumstance in favour of better success in the valleys with the more tender subjects is the fact, that snow (Nature's cloak) falls usually more heavily, and lies longer than in the open country.

Along the courses of the Wharfe and Ure especially, both arboriculture and floriculture are pursued with very considerable vigour, and many are the private estates and gardens where a large amount of success is annually attained. The noble timber found at Bolton Abbey, Fountains, &c., are becoming, year by year, increasingly world-famous; whilst several, Nidderdale or Yoredale gardens, would be more so if better known.

When Baddeley, in his recent excellent *Guide to Yorkshire*, wrote that "a *détour* from Masham to Hackfall (both on the Ure), may be made past Swinton Park, the seat of Samuel Cunliffe Lister, Esq. (now Lord Masham) who owns an appreciable portion of the "shire of the broad acres," it was but a mild hint that there we have one of the finest estates in Yorkshire, and second to few in the British Isles! The Swinton Park estate measures some 22,000 acres, and includes extensive grouse-moors, woodlands in which the timber was valued in 1883 at £80,000, rich pasture-farms, miles of trout-streams, and is one of the three large estates situated in, or contiguous to, the Ure valley under the ownership of the noble lord. The other two, viz., the Jerveaux estate of 11,000 acres, and the Middleham estate of 1000 acres, need not now be further mentioned, though each of them is remarkable in their way, and worthy of special description.

A former owner of Swinton Park, the late Mr. William Danby, though doing much, it is true,

to improve the estate by planting and otherwise, had a most unfortunate craze for building mock Druidical temples, which are distributed about the estate, and by no means improve it, nor serve as a compliment to the holy men of old!

The actual park of Swinton is enclosed by a wall, the circumference of which measures three miles, and contains a large number of fallow deer; and some excellent timber—Oak, Ash, Beech, Sycamore, &c., being beautifully associated or intermingled with the more sombre hues of evergreens. Here some of the finest Silver Firs in Yorkshire may be seen, and also of Larch, one of the latter being over 11 feet in circumference at 4 feet from the ground, and measuring 14 feet 1 inch at 1 foot from the ground.

Since Lord Masham's advent at Swinton, a great many kinds of Conifers and shrubs have been and still are being added, with much care and good judgment. Amongst others, the following may be mentioned as thriving with considerable luxuriance:—

Cupressus Nutkaensis	Abies Douglasii taxifolia
" Lawsoniana	" Hookeriana (Teuga)
" compacta	" concolor
" erecta viridis	" violacea
" Allami	" polita
" stricta	" Nordmanniana
" Backhousiana	" Parryana
" Fraseri	" magnifica
Libocedrus decurrens	Pinus austriaca
Taxodium sempervirens	" Cembra
Larix europea	" Benhamiana
Retinospora plumosa	" excoisa
Araucaria imbricata	" Jeffreyi
Cedrus atlantica	" Laricio
" Libani	" Pallasiiana
Abies Albertiana (Teuga)	" sylvestris
Mertensiana)	Taxus baccata
" Pineapo	" aurea
" pectinata	" fastigiata
" canadensis (Teuga)	Thuopsis borealis
" orientalis	" dolabrata variegata
" Douglasii	Wellingtonia gigantea

Among the main features of this beautiful park is a series of charming sheets of water, surrounded by shrubberies, and beautifully sheltered—a paradise for water-fowl, both wild and semi-domesticated. One of these lakes especially abounds in fine pike and other fish, while the casual passer-by will probably flush wild ducks from the reedy sides, not by dozens, but by the hundred. A domesticated pair of black swans (*Chenopsis atratus*) inhabit the largest of the lakes. The banks of some of these sheets of water have been most effectively treated, artistic effect and horticultural fitness having been well studied and carried out under the direct supervision of the head gardener, Mr. Metcalf. Here and there the turf has reached right to the water's edge for several yards, sometimes relieved by effective groups of Spiræe, Tritoma, &c. At other points there are dense covers of Rhododendron, Laurel, or other low-growing shrubs, which overhang the water, and spread yards away up among the trees beyond.

The overflow water from the largest lake is so arranged that it can either be utilised for propelling the turbines used in electrically-lighting the castle and outbuildings, or be let off into a deep, natural ravine, which is sheeted with Ferns and mosses, and was formerly the sole outlet, the water thereby finding its way under the Quarry Bridge and new road into the Burne. This ravine, deeply embosomed among forest trees is a feature in itself, most enviable on any estate, and is beautiful in its uncultured wildness (see Supplementary Illustrations). Around the mansion itself, on the south side, the country is open and park-like, the beautiful wooded ridge called Nutwith, shutting in the view. Quite near to the building, on the same side, is a small sheet of water, upon which are swans, Canadian geese, and various kinds of ducks; whilst on the west side, the naturally rising ground has been tastefully laid out with rockwork and flower-gardens. Above this again is an elegant conservatory, with symmetrical flower-beds in front. The former containing a large bed of Camellias and well-grown greenhouse plants, such as *Bomarea conferta*, *Cassia corymbosa*, *Clematis*, *Begonia*, *Paeidorea*, *Abutilons*, *Lapageriae*, &c. One magnificent plant of *Lapageria rosea* covers a large portion of the roof, and bears an endless profusion of blossoms.

It is to the kitchen garden and fruit-houses that special attention must be given in this article. Among vegetables and fruit more especially, may be seen what skill can effect when combined with energy and perseverance. There are ranges of excellent forcing-houses, vineries, Peach-houses, greenhouses, &c., and their contents, generally speaking, are very high-class in quality, and excellently grown. An adept at the training of fruit trees, Mr. Metcalf has likewise successfully adopted the system known to Mr. Knight at the end of last century, of making regular-trained trees out of what had become irregular ones, by inarching an irregular branch, either up or down, across the main stem, in such a position that a gap is filled, and the tree artificially made perfectly symmetrical by the new branch thus inarched to the main stem. In some instances this system is adopted several times over on the same tree, and many kinds are thus "improved" in general appearance and fertility. Peaches, Plums, Figs, Pears, Cherries, &c., have been thus treated, and it is specially worthy of note that these altered branches thus treated are often most productive of fruit. Last season, of course, the fruit crop at Swinton was very heavy in almost every kind, enormous crops, especially of Victoria Plums (wall trained) having been obtained. Goose-berry-growing on espaliers is a specialty which is carried out to perfection at Swinton Park. The fruit grown by this method carry very heavy crops of large size, which can be readily protected from the birds by nets, and the system is highly recommended by Mr. Metcalf.

Indoor Peaches, especially Sea Eagle and Princess of Wales, were heavily cropped, but are not favourites, though well done. Among the Grapes were very fine large bunches and berries; the sorts grown are Black Hamburg, Alicante, Lady Downer, Golden Queen, Mrs. Pearson, Venn's Black Muscat, Muscat of Alexandria, and Gros Colmar—the two latter are the favourites. Tomatoes figure extensively; a special seedling raised there by Mr. Metcalf is readily distinguishable from its nearest allies by a peculiar shade of red, and is of considerable merit, both in size, form, and flavour—a cross between Perfection and Dordham Favourite.

Even for comparatively common fruit trees, Mr. Metcalf is in the habit of very thoroughly preparing the ground by excavating inferior subsoil, and after placing good drainage, filling up again with a good feeding soil. In this way remarkable success is attained, and Lord Masham is certainly to be congratulated in the possession of such an estate, and a gardener of intelligence and skill. It will doubtless be remembered that in 1879, Mr. Metcalf was one of nearly 200 competitors for the post of head gardener at the Crystal Palace, London, and only lost it by a casting vote, being equal with the successful candidate, J. Backhouse.

### PICEA MORINDA.

THE Morinda is growing in my garden, about 170 feet above the sea (Ordnance Survey), on the edge of a running stream, the water of which is very limy, so much so, that it petrifies things in course of time, and a stone is formed along the course of the brook, which is a complete petrified stone, called Travertine, containing 84 per cent. pure lime. This is a most valuable stone for building, and our church, 800 years old, is built entirely of it. I have quarried and used for some years quantities of this stone for building purposes, and have lately built a lodge of it. It is a white stone, very light, and easy to cut with an axe or saw, but hardens on being exposed to the air; and I have cattle-sheds here of it built 200 years ago. The Morinda hangs over this stream, and doubtless the water gets to the roots of it. The tree is well sheltered from the north-west, west, south-west, and south, lying in a hollow, surrounded by hills, 300 to 400 feet higher; the top of it is exposed to the north-east, east, and south-east; it is not perfectly upright, but leans slightly, and several of the larger upper branches have

turned upwards again, and have formed almost a young tree on each, some 40 ft. from the ground. The main largest branch was broken off four or five years ago by the weight of snow on it; this had formed a veritable young tree. The lower branches drooped on the ground, forming a fringe round the tree. This I had removed, as it got dead-ended every few years. I am now referring to twelve or fourteen years ago; but now, at the present time, none of the branches reach within 5 or 6 feet of the ground, and the tree is certainly at a standstill, if not going back. At one time you could hardly see daylight, looking up the bole of the tree; but now it is naked and bare in many places. Very few cones grow now, and I am certain the tree is going down hill. The tree has a clear straight stem of 25 feet or more, without a knot or branch, then an immensity of branches starting in all directions from the trunk. It was planted originally too close to a Yew which is said to be 400 years old, and two have grown against each other, which has spoilt the two trees. Conifers of all sorts do well here, there are several fine specimens round the garden grounds, which my old cowman, now dead, told me he had helped his old master to plant as nearly as possible sixty-five years ago from now—chiefly common Spruce and *Abies nigra*. I have planted lately, three to four years ago, a quantity of Conifers of all sorts here, in a belt round the western side of the gardens, and they are all doing well, with the exception of *Abies orientalis*, *finlandensis*, and *polita*, which do not seem to get on like the others, but *lasiocarpa*, *grandis*, *nobilis*, *C. atlantica* and *C. Deodara* grow wonderfully well. I have some good Douglas, planted twenty years ago, also a grand *Thuja* (moved as a small shrub twenty years ago), which covers, I think, 12 feet of ground (12 feet diameter), and towers above everything else of its age. I have also planted a quantity of *Thuja* of different sorts, and they all grow remarkably well here, after once getting a start; on this strong loam they are more backward in starting, but when they catch hold of the ground they make good growth. I am thinking of planting a quantity of Douglas in the woods for timber and for game covert, but they are so very expensive to buy from the nurseries. I am going to buy seedlings of them this spring, and plant them for a couple of years or so in a nursery, and then plant out; we have to protect much here from rabbits, which spoil everything not wired in. The hard winter last year did us a great deal of damage, especially to the shrubs, and one *Deodara* (thirty years old or more) lost all its needles, and was quite bare in the spring, until the young shoots came, but this was helped partly by the smoke from the greenhouses, which blew into the tree when the wind is south. I have heard that the *Morinda* was mentioned in one of the papers many years ago, but am not certain [see *Gardeners' Chronicle*, June 8, 1872, p. 766]. I think there are some good specimens of *Morinda* at Witley Court and elsewhere, grown from seed off my tree, specimens probably thirty or forty years old. *Montague H. Taylor, Shelsley Walsh, near Worcester.*

### ORCHID NOTES AND GLEANINGS.

CYPRIPEDIUM × CHARLES RICKMAN.

IN Capt. Schofield's collection at New-Hall-Hey, Rawtenstall, is a well-grown plant of this beautiful hybrid. This collection has been in existence to my certain knowledge for over a quarter of a century, and the owner has grown many choice Orchids during that time, his taste latterly favouring *Dendrobes* and *Cypripeds*. Among a collection of the latter, this hybrid (*barbatum* × *bellatulum*) stands clearly out as a gem, and one in which the *bellatulum* strain is very pronounced. The vigour of growth of *barbatum* is very noticeable, consequently the peduncle is twice the length of that of a typical *C. bellatulum*, while the foliage is beautifully marked and otherwise vigorous. The flowers, of which one peduncle was carrying two, was an admirable suffusion of the spotting and flushing of the pollen-parent, with the rich tawny colour of the seed-bearing parent. The dorsal sepal is roundly ovate, with

radiating rays of a deep vinous-purple colour, lightish ground, the centre rays being Indian-red; it measured 2 inches across the centre. The inferior sepal is about half the size of the dorsal, and involute. The petals in their breadth are very striking, and they are ovate, rounded at the extremity, with the pleasing spots of a vinous-red, which same tint is diffused over the pale ground colour. The breadth of these lines is  $1\frac{1}{8}$  inch. The pouch is that of *C. barbatum* in shape and colour, but of a richer finish, and the size proportioned to the other parts of the flower. The staminode is prominent, also richly coloured, resting in the base of the upper lobes of the lip. This is certainly a worthy addition to the *C. bellatulum* crosses, which

increase in size each year, and the leaves possess the deep-green tint which is the best sign of health. The temperature of the house in which the plant is growing is not allowed to fall below 50°, nor is great heat afforded at any time, not even in the summer, air being admitted freely to reduce the temperature. This white-flowered Lycaste is a favourite with every orchidist, and it has the great merit that it continues to bloom for a long period of time. *J. A.*

CATTELEYA LABIATA, WHITE VARIETY.

In the beginning of last month flowers of a very handsome variety of *Cattleya labiata*, with pure white sepals and petals, and having a crimson-purple tinted blotch on the lip, was sent by Joseph Broome, Esq.,

RHODODENDRON × NUMA.

The complex hybrid illustrated (fig. 20) is a remarkable acquisition, and is interesting both in its horticultural and scientific aspects. As shown by the pedigree given below, four distinct species of *Rhododendron* are concerned in the ancestry, the result of the various crossings being a distinct and beautiful plant that will prove a valuable addition to horticultural resources for the decoration of the warm conservatory and greenhouse at a season of the year when such additions are most needed. Its great merits as such are its dwarf habit, neat foliage, floriferousness, and the pleasing and bright colour of its handsome trusses of flowers. It was raised in the Chelsea

FIG. 20.—RHODODENDRON × NUMA, AND ITS PROGENITORS.

are now becoming common. It has been grown here for nearly two years, and Mr. Jones, the gardener, says that he finds the plant grown in the ordinary materials, with a few chips of limestone intermixed, is very free in growth.

LYCASTE SKINNERI ALBA.

In an intermediate-house of A. Warburton, Esq., Vine Lodge, Haslingden, is a specially-grown piece of *Lycaste Skinneri alba*, which has been flowering for some time, and will continue in bloom for months; it has flowers of fine form and purity. It is a plant that is neither over-potted nor excessively supplied with water, and its leaves and pseudo-bulbs are flawless. It is kept near the light, and the owner and his gardener are careful not to move it from a place where it has done so well. The pseudo-bulbs

of Sunny Hill, Llandudno, which is interesting for various reasons. The flower resembles those of *C. labiata* Cooksonia; but if it is like *C. l. Cooksonia* of the autumn-flowering class, it must have been in the country long before any other white forms of that favourite winter-flowering Orchid, for Mr. Broome had it some years ago when he grew his fine collection of Orchids at Wood Lawn, Didsbury, Manchester. The plant was removed to Llandudno when he went to reside there. It may be that it is a singular form of *C. labiata* Trianei, although in texture, odour, and general appearance it looks more like a white autumn-flowering *labiata*. It seems to prove that in good hands Orchids need not necessarily degenerate, for Mr. Broome has grown this from a very small plant. This year it bore three fine spikes of flowers. *J. O'B.*

establishment of Messrs. James Veitch & Sons, who received for it an Award of Merit from the Royal Horticultural Society on November 12, 1895.

Perhaps the most noteworthy fact in the origin of *Rhododendron × Numa*, is its being a connecting link between the Indian Azalea and the Javanico-jasminiflorum group of hybrids. It is now nearly 15 years since Mr. Heal, a foreman at Messrs. Veitch's Chelsea nursery, commenced a series of experiments with the object of bringing about a union between the Indian Azalea and the Javanese group of *Rhododendrons*. The success so far achieved has been but very partial; the seedlings raised from the crosses have been very few in number, and these are slow in growth, and shy in flowering. This is no more than might have been expected from attempts to cross species botanically regarded as belonging to two

very distinct sections of the genus, such as are *R. indicum* and *R. javanicum* and its nearer allies; and it is, moreover, quite in accord with the experience in hybridisation gained in Messrs. Veitch's establishment. Nevertheless, the cross has been effected, and the first result was described and figured by Rev. G. Henslow in the *Journal of the Royal Horticultural Society*, vol. xiii., p. 258. To render that acquisition more available for horticultural use, Mr. Heal fertilised a flower of the free-blooming species *R. multicolor* var. *Curtisii*, with the pollen of the indico-javanicum hybrid, which has proved a happy hit for the resulting progeny, *R. X Numa*, although of dwarf habit, grows as freely and flowers as profusely as can be desired.

In the illustration at fig. 20, the central plant, No. 1, is the new hybrid *Numa*. Its progenitors are indicated by numbers on the woodcut, with corresponding numbers on the pedigree beneath. Thus, the first cross was between 2 (*jasminiflorum*), and 9 (*javanicum*), and so on.

### A COLLECTING TOUR IN JAMAICA.

LEAVING home early in the morning, accompanied by a native collector to dry and look after such specimens as might be gathered, and a muleteer with a pack-mule loaded with drying paper, change of clothes, &c., we started on the first day's journey, a distance of about 35 miles, over a rugged and, in places, dangerous track. In a distance of about 30 miles we had to descend from near 5000 feet altitude to sea-level, in fact from the Blue Mountains to the coast. The first 6 or 7 miles of our track led us through forest land. Here may be seen huge *Yacca* (*Podocarpus coriariensis*), and other fine timber-trees, literally covered with Orchids, Bromeliads, Ferns, mosses and lichens; magnificent Tree Ferns, from 10 to over 30 feet high, with smaller growing Ferns, Filices, Selaginellas, mosses, &c., growing everywhere in the greatest profusion; *Datura suaveolens*, with its sweet-scented flowers; and the graceful wild Bamboo (*Chusquea abietifolia*), climbing amongst and over the bushes, and hanging in elegant festoons.

The soil is covered to the depth of a foot or more with leaf-mould and vegetable debris. Everything is damp and covered with dewy moisture, although no rain has fallen recently. Small streams cross the track at intervals, and a short distance off, on another spur of this great range of mountains, one gets occasional glimpses of a fine cascade tumbling over the precipitous rocks. The shade is dense, and the sun rarely penetrates, so that the air is always cool, the temperature probably ranging between 50° and 60° Fahr. This is where Ferns grow in luxuriance. At first sight it would appear that every conceivable form is here represented, but on closer examination it is soon found that the number of genera is small. *Nephrodium*, *Asplenium*, *Aspidium*, *Davallia*, and *Pteris* predominating, with, of course, *Hymenophyllum* and *Trichomanes* growing on almost every tree trunk, and the Tree Ferns, *Aleophila*, *Cyathea*, *Marattia alata*, *Danaea Moritziana*, and *Botrychium virginianum* are plentiful, growing in ravines, and in very shady, wet places. Selaginellas carpet the forest.

Leaving this Fern-clad forest, we entered a somewhat open country, with rather steep hills, which have been denuded of their fine forest growth, and are now covered principally, where not under cultivation, with bracken (*Pteris aquilina*), *Gnaphalium* (*Panicum maximum*), and a confused mass of many species of Malvaceæ, Leguminosæ, Myrtaceæ, Melastomaceæ, Compositæ, &c. "Bush" is the apt colonial term applied to stretches of mixed growth of this description.

Negro provision grounds are fairly numerous, and a few settlements are met with. The crops chiefly grown by people in this district are Yams, Cocoes (*Colocasia*), Bananas, Plantains, with here and there a patch of Coffee, Sugar-cane, Maize, Cocoa (Chocolate), and a few Breadfruit and other trees.

The soil is good, and, for a few seasons after the woodland is cleared, it yields enormous crops of Yam, &c., and with the aid of manure and proper methods of cultivation would doubtless continue to yield good crops; but as soon as the surface-mould becomes exhausted, or gradually gets washed off into the nearest gully or watercourse, the piece of land is abandoned, and allowed to revert to "bush," and a fresh clearing is made.

We rode for several hours through such land, stopping now and then to gather specimens of a tree or shrub noticed in flower or fruit, or to explore a likely ravine or thicket for such specimens.

As we drew nearer the coast, along the Swift River valley, we passed through abandoned sugar estates, and there was a decided change in the vegetation. Cocoa-nut Palms, Bananas, and Bamboos were the predominant features in the landscape; patches of Sugar-cane there were also, and around the negro huts were Chocolate, Lime (*Citrus*), Coffee, Annatto bushes, with the beautiful Akee, Kola-nut, and Avocado Pear trees. In the pastures were enormous Silk-cotton and wild Fig trees, and still nearer the coast the beautiful Mahoe tree (*Hibiscus tiliaceus*) is plentiful; also the Broad-leaf (*Terminalia latifolia*), Horse-wood tree (*Pithecolobium latifolium*), Rose-apple (*Eugenia Jambos*), and clusters of the magnificent Anchoy Pear tree (*Grias cauliflora*). Here we first noticed the "Sabana" Calabash (*Crescentia cucurbitina*), and on it we found in flower the pretty little *Ionopsis testiculata*. Farther on we noticed abundance of *Portlandia grandiflora* in flower, a very beautiful shrub, growing in the crevices of the limestone rocks. A space of probably 100 square yards of rock near the Swift River course was quite covered with *Davallia clavata*, an extremely elegant Fern, its creeping rhizomes running in every direction, and clinging to the damp limestone. *Ipomoea* of varied hues, *Entada scandens*, *Securidaca Brownii*, *Fevillea cordifolia*, *Philodendron*, *Syngonium auritum*, *Cardiospermum grandiflorum*, and numerous other climbers and creepers clothed the trees, trunks, and branches. Some of the large Silk-cotton trees were veritable tropical gardens, so covered were their huge limbs with Bromeliads, *Tillandsias*, *Echmeas*, *Guzmanias*; and Orchids, such as *Schomburgkia Lyonsii*, *Epidendrum fragrans*, *E. cochleatum*, *E. polybulbon*, *E. fucatum*, *Seraphyta multiflora*, *Oncidium luridum*, *O. triquetrum*, and others.

During the latter part of our first day's journey hundreds of peasantry passed us with bunches of Bananas; men, women and children carrying the bunches on their heads. Many of the men carried two bunches, one in a net slung on the back, the strap or band of the net placed across the forehead, and the other bunch balanced on the head. The women, boys and girls, usually carried one bunch each. They also had numerous donkeys loaded with fruit, each little animal not much bigger than the four bunches of fruit, two slung on either side, that it carried. These people were all hurrying at a jog-trot to Hope Bay to dispose of their produce, where they would get from 6d. to 9d. per bunch, according to size and quality.

The new line of railway, now in course of construction, runs through here, and on to Port Antonio, some 10 miles further along the coast. The line is being built by Americans, and, of course, everything American prevails. Even the Jamaica negroes employed as labourers on the line are beginning to "guess" and "calculate," and cultivate the American twang, and the results of their efforts are often most ludicrous. The work of excavating and levelling is progressing rapidly and in a very orderly manner. A large number of the famous Kentucky mules are employed on the line. They are splendid-looking animals, standing 16 and 17 hands high, and in excellent condition. The change of climate does not appear to have affected them in the least.

Hope Bay, like most of the villages or small towns on the north-eastern coast, is merely a collection of small houses and huts, uninviting and uninteresting. We got out of it as quickly as possible, and pushed on for St. Margaret's Bay, a village five miles to the

east, on the outskirts of which was our halting-place. Between these two villages is an almost continuous stretch of Cocoa-nut Palms and Bananas, extending for some distance inland. There are also some lagoons and swamps, in which we collected various water plants. We reached our resting place late in the evening, having been thirteen hours on our journey. We came through a splendid fertile valley, the scenery grand, and the vegetation tropical, luxuriant and beautiful. At every turn there was something to attract our attention, something to excite our admiration and wonder. Next morning we decided to explore the banks of the Rio Grande for a few miles up. This is a magnificent river, the second largest river in Jamaica, but owing to the hilly nature of the country through which it runs numerous rapids are formed—consequently it is of little use for navigation. It takes its rise in the Blue Mountain range above Bath, and on its course receives many tributaries from the same range of mountains. It empties into the sea at St. Margaret's Bay, where it is crossed by a fine iron bridge of six spans, each 80 ft. in length. This river passes through a splendid stretch of country, the soil deep, rich, and fertile. Here thousands of acres of Bananas are grown to perfection. We went up the course of the river about 4 miles, and in that distance had to ford it eight times. This had to be carefully done by keeping the heads of our animals well up stream. A careless rider or animal runs the risk of being carried down by the strong current. When this river is in flood, after heavy rains in the Blue Mountains, it is very formidable, and fording is out of the question. The waters rise 10 or 15 feet, and immense trees are washed off its banks and carried down by the raging torrent like strips of cork. Although not navigable for large boats, during fine weather "dug-out" canoes and rafts are employed to a considerable extent. By means of these, the settlers for several miles up the banks of the river convey their Bananas and other produce to St. Margaret's Bay. The "dug-out" canoes are made out of the trunks of the Ceiba or Silk-cotton tree (*Eriodendron anfractuosum*), or the West Indian Cedar (*Cedrela odorata*). The great trunks are hollowed out and fashioned to the requisite size and shape. Rafts are made of Bamboo-stems lashed together. When a canoe or raft is loaded with bunches of Bananas, a man stands on the end of his craft, and with a long pole steers it, the force of the current carrying it down stream. These men perform this work with great skill and dexterity. Bananas, Cocoa-nut, and Chocolate are the principal crops grown on the banks of the Rio Grande, but Yam, Cocoes, Maize, Sugar-cane, &c., are also grown to a considerable extent. The Banana, however, is here the crop *par excellence*, and the Cocoa-nut Palm comes next.

Many planters are now establishing Chocolate through their Banana plantations. The Banana acts as a shade for the young Chocolate, and the return in fruit is sufficient to pay for cultivation till the Chocolate begins to yield a crop.

To show the enormous trade which has been developed in Bananas and Cocoa-nuts within a few years, the following figures are quoted from official returns for the year ended March 31, 1895: Bananas under cultivation, 19,528 acres; number of bunches of fruit exported, 4,768,761; value of bunches of fruit exported, £128,886; Cocoa-nut Palms under cultivation, 9,061 acres; number of nuts exported, 10,143,500; value of nuts exported, £36,770. In 1874 the number of bunches of Bananas exported was 85,083, valued at £6,381, and of Cocoa-nuts 1,359,895, valued at £3,739.

The Banana thrives best in deep, rather open loam, with plenty of humus, in warm, moist valleys. It is a voracious feeder, and quickly exhausts the surface-soil, so that to produce regular and good crops good cultivation is necessary. The plants are put out in rows 18 to 20 feet apart, with a space of about 15 feet between the plants in the rows. All the old stems and leaves are heaped around the growing stems and moulded, and help to manure the soil. On large plantations, American "cultivators" and ploughs worked by oxen are freely used amongst

the rows. Where Chocolate has been planted amongst the Bananas, the land is regularly forked and kept open. *W. Harris.*

(To be continued.)

### THE CARNATION AND ITS CULTURE.

(Continued from p. 53.)

THE question of the most suitable soil and its preparation for successful Carnation culture is such an important matter, that, at my request, Mr. C. Blick furnished me with the particulars of his own method, as adopted in "Border Culture," at Warren House, which I embody nearly in full.

For the beginner, the Carnation season may be taken as commencing with the latter part of September, or the beginning of October, when the layers are ready to be taken off the old plants. The beds are trenched to the depth of 18 inches. The soil of the first trench is thrown out, and the bottom or sub-soil broken up; then a good layer of cow-manure is put in, the top-spit of the next trench being turned on to the manure, at the same time keeping a very sharp look-out for wire-worms—which Mr. Blick rightly considers one of the worst enemies to Carnations—then another layer of cow-manure, and so on as the work progresses. With the fine soil is incorporated a good dressing of lime-rubbish and soot.

When the trenching is finished the beds are well trodden down, the sides thrown up, and the whole levelled over with a rake; being then ready for planting. The beds when finished should show a rise of 5 or 6 inches from the surrounding soil. It is recommended that the planting should be done as nearly as possible in the middle of October—in fact, all planting should be finished by the end of that month, in order that the plants may become well established before severe weather sets in. The layers should be planted moderately deep and firm, setting them out 10 to 12 inches apart each way; or another excellent plan is to plant in sets of three, placing them triangularly, which forms a clump. Should the weather be very dry, a copious soaking with water will be beneficial. Mr. Blick says, plants treated in the foregoing manner in the year 1894 came through the severe weather of that season admirably; in fact, they did not lose 1 per cent. of their Carnations. It is advisable, however, to place a few plants in 3-inch pots, to fill up any vacancies which may occur during the winter. The soil recommended for the plants in pots is two parts fibrous loam and one part of well-decomposed leaf-mould, with a good sprinkling of sand. After potting, a liberal supply of water should be given, the pots then plunged into Cocoa-fibre or coal-ashes in a cold frame, the plants being raised up as near the glass as possible. The lights should be kept off in all favourable weather, and on no occasion must they be kept closed, not even in the severest weather.

If the season is open, the plants should be looked over every week or each ten days for green-fly, also to remove decaying foliage. The time recommended for filling up vacancies in the beds is about the last week in February, or the first week in March, according to climatic conditions.

Mr. Martin R. Smith, in 1894, submitted a sample of his soil as prepared for Carnation culture, to chemical analysis, which gave the following analysis:—

	Per cent.
Sand ... ..	79.924
*Organic matter and combined water ...	12.582
Oxides of iron and alumina ... ..	5.240
Carbonate of Lime ... ..	1.037
Magnesia ... ..	0.259
Phosphoric Acid ... ..	0.369
Sulphuric Acid ... ..	0.076
Potash... ..	0.258
Soda ... ..	0.112
Chlorine, &c ... ..	0.165
Total ... ..	100.000

In regard to the soil question, however, Mr. Martin Smith says:—"My own firm belief is, that the

\* Containing nitrogen, 0.388; equal to ammonia, 0.469.

vigour of a Carnation plant is by no means entirely dependent upon the soil it grows in, but to a far greater extent to its own inherent vigour of constitution. I have plants (seedlings) in the same bed, some of which are dying, and some actually dead, and close alongside of these others (without exaggeration) almost as big as small Gooseberry bushes. I find my own strain of Carnations, as a rule, very much more robust than those I buy from the trade, so much so that I have practically ceased buying plants which I know will pine and probably die. My firm belief is, that the general cause of the weakness of constitution so universal is to be found in the method pursued in the propagation of any new variety that has attracted attention. It is generally layered the first year, and in the second year there may be from eight to thirty plants of it existent. If it is a success, some nurseryman buys it, and between the time he gets it and about a year, he has to produce a sufficient number of plants to satisfy the demand. The plants are all placed in heat and forced into growth, and then every scrap that can be cut from them is struck as a cutting; these again are forced on, and in their turn cut to pieces, until all the natural strength and constitution of the plant is lost, never again to be recovered. I propagate entirely by layers, and from my own strain never get a weak plant. I do find, however, an enormous difference of growth in plants placed into good fresh loam, as against any compost of old soil and manure that can be conceived."

Mr. Lombard says: "Nature's method of increase is by seed, but this has proved so uncertain and slow with the Carnation that the wisdom of man has devised a way to multiply by cuttings. The gardener is thus enabled rapidly to increase such varieties as are found best suited to his needs; by this means are retained the same characteristics, whether they are desirable or not. But while the cutting takes a separate existence, it seems that when this method is carried on year after year, the process of deterioration goes on also, until the vital force of the variety becomes so much impaired and weakened, that it ceases to have sufficient strength to maintain its existence, and continues profitable to the grower. Whenever man supercedes Nature's course we find more difficulties to surmount.

"It is important to remember," remarks Mr. Lombard, "that no matter how excellent the varieties, or how vigorous and healthy the plants, success in pot-culture will, in a great measure, depend on the manner of lifting and planting, and their treatment for the sixty days following their transfer to the greenhouse. The Carnation should not be overfed, nor grown in a high temperature, for if this is done, its constitution becomes impaired, and disease quickly makes its appearance." The insect enemies of the Carnation are few; a weekly fumigation with tobacco, and humidity at 74 per cent., will prevent their appearance; where red-spider can live, the Carnation has not a congenial home. *J. J. Willis, Harpenden.*

(To be continued.)

### JAPANESE LILIES AS ARTICLES OF FOOD AND COMMERCE.

LILIES possess the quality of combining beauty with gastronomic value; indeed, in Japan they are considered even more useful than ornamental, and in books on horticulture and botany we find these plants treated more frequently under the group of edible than of ornamental subjects; that is, far more account is made of the bulbs of the Lily than of its flowers. I do not mean that the beauty of the many varieties, in their manifold shapes and sizes, in their rich colouring of crimson, pink-vermilion, yellow, white, purple, and orange, is not appreciated by us; far from it, and not a flower-garden is regarded complete without them. At the same time, there never is a well-chosen menu which does not include this bulb among its dainties. Moreover, from time immemorial we find Lilies thus mentioned, both for their utility and beauty. No wonder, as different varieties grow wild and luxuriantly on hills and along

dales throughout the length and breadth of the country, our forefathers could but notice their flowers, conspicuous even in the rich flora of Japan, and a little examination could not fail to convince them of the abundant store of nutritive material in their bulbs. According to Miquel, and to Franchet and Savatier, there are no less than seventeen Japanese species of Liliium, but these include a large number of varieties.

The Ainu, an aboriginal race supposed to have once inhabited the whole country, but now confined to a few scattered hamlets on the northern islands of Hokkaido (Yesao of older maps), where they still subsist by fishing and hunting, depend for their vegetable diet chiefly on the bulbs of Liliium Glehni. From the bulb of this plant, called Turep in their language, the Ainu extract a comparatively pure kind of starch. This they make into a hard cake with a hole in the middle, through which a string is passed to hang it by. We can easily imagine that our ancestors may have done likewise, since many varieties flourish in the south, although the climate and the soil there are not as favourable to the growth of Lilies as are those of the Hokkaido, whether we consider the colour or number of the flowers or the size of the bulbs. On Hokkaido we often meet with a stalk bearing as many as thirty flowers, and that without any fertilisation. Especially where there is moisture do they thrive well. By the side of brooks, which are found everywhere in the mountainous districts of the country, our eyes are constantly greeted by the various members of this charming family. Even in their wild state the flowers of Liliium auratum attain a size of over 6 inches in diameter. The bulbs of nearly every variety are edible, but those of wild growth always taste sweeter than those under cultivation. It is said that over one hundred different varieties were known to the gardeners of past centuries, though at present only a little over half that number are cultivated.

The two kinds most need for culinary purposes are the Liliium tigrinum, known here as the Oni-yuri (literally, the Ogre Lily), or Ryuri-yuri (the Cooking Lily), and the Liliium concolor, var. pulchellum. This latter is also called Hime-yuri (the Princess Lily). Chemical analysis has shown that we have not been deceived in our appreciation of this plant. It proves that the bulbs contain no small amount of nitrogenous matter. I will here give the result of the analysis made at the Government Sanitary Bureau:—

Water ... ..	69.630
Nitrogen ... ..	3.402
Fat ... ..	0.015
Starch ... ..	19.109
Dextrin ... ..	1.915
Glucose ... ..	0.820
Pectose ... ..	2.444
Fibre ... ..	1.416
Ash ... ..	1.950
Total per cent. ... ..	98.867

From this table it is clear that the Lily-bulbs furnish an important source of nutriment. A little plot of 6 feet square can be made to yield from sixty to seventy bulbs, and at this rate an acre will produce some 80,000 bulbs. These are produced, according to official statistics of 1888, 43,000 lb. of bulbs in the market gardens of Japan, valued at 9300 yen. These numbers do not, and cannot, include those raised in private gardens. In price they range from half a cent to 2 cents apiece, according to their size and to the season. They are usually boiled and eaten with sugar, otherwise they would be too bitter to be palatable. When they are boiled soft they remind us of Beans, both in their consistency and taste. The bitterness seems to lie especially along the edge of the bulbous scales; and, consequently, by slicing the edge before cooking greater sweetness is insured. The bulbs are also very often boiled with rice. The starch made from them will keep indefinitely, and was, therefore, in former times stored to ward off the sufferings of famine. The variety longiflorum, Thunb., called the Teppo-yuri (the Gun Lily), otherwise known as the Riu-kin-yuri, because of its supposed original habitat, is

esteemed for its flowers, but its bulbs are too bitter for kitchen uses. They give, however, starch of excellent quality. A variety known as Aka-kanoko, which grows to the height of 4 feet, with flowers spotted crimson, has bulbs of a purplish colour, bitter, and altogether unfit for cooking, but furnishing starch of no mean quality. The best way to cook the bulbs for the American table is, we have found from experience, to boil them, and use them as salad, with a dressing of cream and eggs. The small bulblets that appear at the axils of Lily leaves can also be eaten roasted, and the petals of some varieties growing wild in Hokkaido make an exceedingly pretty salad.

This reminds me that some years ago a Harvard professor said that the future food-supply of America could be greatly and advantageously increased by acclimating foreign, and especially Japanese, edible plants. I was, therefore, pleased to hear, recently, that the Department of Agriculture has been circulating reports regarding the cultivation and culinary uses of Lilies. But, as it will take some time to naturalise them in America, the importation of bulbs will not at once be perceptibly decreased. In fact, these bulbs have for some years been an article of export to Europe and America, and we at one time thought that they would soon become naturalised abroad, and were afraid the trade in them must soon cease, but thus far it shows no diminution. Take, for instance, the amount exported from but one firm in Yokohama, the Ueki-shoksi, in 1890—some 913,880 bulbs were sent out, including thirty-one different varieties. Among them the so-called Mountain Lilies (Yama-yuri) were by far the most important, their number amounting to 550,569. The next most important variety was the Gun Lilies (Teppo-yuri), and these amounted to little over 136,000.

The following table gives later statistics of the extent of foreign trade in Lilies, as exported from the country at large:—

Countries.	1894.	1893.	1892.
	Yen.*	Yen.	Yen.
Australia ... ..	1,550	185	610
France ... ..	1,308	485	281
Germany ... ..	11,261	5,562	2,620
England ... ..	29,630	38,734	17,943
Hong-Kong ... ..	4,328	6,480	2,166
United States... ..	19,410	12,679	9,481
Other countries ... ..	737	1,233	392
Total ... ..	68,224	65,423	33,478

The Yama-yuri, mentioned as playing such an important part in exportation, is of wild growth, and although its good qualities are appreciated at home, the Japanese consider it inferior for table use to the Ryori-yuri, and the demand for it here is not so great as for the latter. During an epidemic of cholera a few years ago it was, however, sold in large quantities to supply the deficiency of starchy food in the market.

The readers of *Garden and Forest* may be interested to know what care is taken in raising the bulbs. In October or November, when the stems of the Lilies wither, the bulbs are gathered; but, as they are too small for trade in this natural state, and, moreover, as they are so often more or less bruised when dug out, they are planted in a garden to undergo artificial cultivation for a year or two—a process of fattening, as it were, for the market. Those designed for export to European countries require particular care, since they must endure the heat of the Indian Ocean during their journey. Then, too, European taste demands large bulbs, and plants with about twenty flowers, which only bulbs of two years' artificial cultivation can bear. Americans, on the contrary, like smaller bulbs, and desire plants that bear only half a dozen flowers. Bulbs of one-year's rearing, therefore, meet their wishes; but these die the next year, and hence the regular annual exportation of new bulbs to the United States.

\* A yen is equivalent to an American silver dollar.

The Yama-yuri is indigenous to Kadsusa, Shimosu Sagami, and other central provinces. The transplanted bulbs, reared in a rich garden mould, become quite strong after a year's growth, but those intended for food are not allowed to flower. Sometimes, when the soil is not of the proper kind, the bulbs, though they may grow large in size, are decidedly inferior in weight. Perhaps on this account they do not do well in Europe, except in the Netherlands, the classic land of bulbs. Some of our best bulbs measure a foot or a foot and two inches in circumference, and weigh as much as a pound. I may state here that for choicest cooking; only the twelve best scales are selected from a bulb; indeed, usually eight or nine scales only are taken from each. The size and shape of the bulbs are most remarkably affected by the time when the flower-buds are nipped; and some Lily gardeners think the right choice of this time is the most difficult and delicate part of their labour. When the bulbs are harvested, they are cleaned and then packed in boxes large enough to contain forty or fifty. In price, they range for export trade, according to size (taking for granted that the quality remains the same), from 2.20 to 2.50 yen per hundred for the largest; 1.20 to 1.50 for the next size—of, say, 10 inches in circumference; and 60 yen or so for bulbs of a year's growth, which are usually about 8 inches. Inazo Nitobe, *Sapporo, Japan, in "Garden and Forest."*

## FLORISTS' FLOWERS.

### CACTUS DAHLIAS.

THE so-called Cactus varieties of the Dahlia are scarcely effective as garden plants, though there are a few exceptions, notably Matchless, whose blooms are thrown well above the foliage; and there is still much to be done before these Dahlias are brought into that admirable condition of habit which characterises the Pompon section, the most floriferous and effective of all varieties for outdoor culture. The original type as presented in the scarlet Juarez is more refined, whilst the flat-petalled forms, now termed "decorative," are becoming effective as such. It is not too early to obtain plants from the florist, where no stock roots exist to propagate from, because early ordering ensures strong plants in May. Those who possess stocky roots, may now start them into growth, and strike the young solid shoots as they are obtainable. A good dozen of varieties now in commerce are Mrs. Peart, Lady Penzance, Harmony, Delicata, Mrs. H. Cannell, Bertha Mawley, Robert Cannell, Juarez, Major Haskins, Earl of Pembroke, Purple Prince, and Matchless. These are of the best. Charming newcomers of last year are West's Valkyrie, Heyner's Fasilier, and Royal George, Turner's Endymion and Beatrice; Cheal's Mrs. Wilson Noble, and Ware's Mrs. A. Beck. Trench the ground deeply, but do not too highly enrich it with manure; mulching in the summer being efficacious.

### POMPON DAHLIAS.

Next to the Cactus forms as eligible cut flowers, but before them as outdoor garden flowers, come the beautiful Pompon Dahlias. Though described as miniature show and fancy forms, it is doubtful whether we do find in these, in many cases, forms superior to what many show-flowers can display. Still, it may be easier to furnish the perfect rotundity. Show-flowers should be present in smaller blooms than in large ones. No doubt Pompon Dahlias give three times as many blooms as Cactus Dahlias, but then there is such a remarkable difference in the flower's appearance. For perfection of form and build the Pumpions cannot be excelled for beauty; the Cactus flowers are best by a long way, and as quality and charm in flowers is of more importance than is mere quantity, no wonder the singular Cactus flowers are so popular. However, all are not devoted to them; or if to them, at least not alone; and the next favourite section, without doubt, is the Pompon. There is such a great number of these that selection is more easy, yet more difficult; easy, because there are so many, and all so good; difficult,

because the quality is of such average excellence. Of whites, Lady Blanche and White Aster, cream-shaded; Ceres, salmon; E. Junker and Riogdove, yellow Emily Hopper and Sovereign, carmine; Janet and Phoebe, lilac; Lilian and Mabel, scarlet; Sanabine, Bacchus and Mars, crimson; Favorite and Arthur West, maroon; Little Darkness, and Captain Boyton. Good tipped or edged flowers are Admiration, Eurydice, Laelia, and Cristabella. This is a list of the very best, not made up from a catalogue, but culled at one of the London Dahlias shows when blooms were not only plentiful, but in first-rate form. A. D.

### DOUBLE PRIMULA MRS. A. F. BARRON.

This is one of a batch of seedlings introduced by the late Mr. Richard Gilbert, of Burghley Gardens, Stamford, and now to be seen in very fine character at the Royal Nursery, Slough, where there is a small span-roofed house filled with it, the plants in large 48-sized pots blooming with remarkable freedom. The mistake is sometimes made with the Chinese Primrose of growing the plants so much for foliage that but small heads of bloom result, but this is avoided at Slough; the growth is vigorous and yet spare, and the plants bloom with the freedom of the old double white. Mr. Turner speaks in high terms of it, and prefers it to the old double white variety for cutting for bouquet-making purposes. The flowers, which are of larger size, and fuller than those of the double white, are of a very delicate lavender tint when they open, becoming with age of a pure white. The extent to which this variety is cultivated at the Royal Nursery shows that it is highly appreciated. R. D.

## NEW AND OLD FAVOURITE VEGETABLES.

THE time to order seeds of the nurseryman has come, and those gardeners who have the fancy for trying novelties, and the requisite area of kitchen garden land to devote a small piece to some of them, should not omit to include a packet or two when writing out the seed order. The first to be named is the Climbing French Bean, a prolific, long-bearing variety, growing to a height of 5 feet; in fact, a Canadian Wonder (Red Flageolet), that flowers and bears pods for months—thus it is a saving of land and labour. Whilst writing of Beans, we think that the yellow-fleshed Butter Beans should be tried; they may not be so nice-looking when simply boiled in salted water as the green Beans, but then they should not be so prepared for table, but heated for about five minutes after taking them out of the water in which they have been cooked, in a savoury kind of sauce.

Celeriac is as easily grown as a Cabbage, and its roots when cooked make a nice winter salad, cut in thick slices like Beet-root; and they are palatable either alone or mixed with other things. For flavouring, the root is equal to the blanched Celery, and by thus making use of it the stock of the latter lasts longer. "Crosnes" (*Stachys tuberosa*) should not be forgotten. The sets are cheap, and the cultivation simple. Lily-white Seakale and the white Jerusalem Artichoke are desirable varieties of common kinds of vegetables. There are two varieties of Fennel which some English, and certainly foreign cooks could turn to good account, viz., Florence Fennel, an annual plant, with a distinct, low-growing, thick-set habit, which has joints very close together towards the base. The leaf-stalks overlap each other at the base of the stem and form an enlargement of the size of a hen's egg, and larger, white, and sweet inside. Seed should be sown in the spring for a summer crop, and towards the end of the summer for an autumn crop, sowing in rows 18 inches apart. The other variety is *Foeniculum piperitum*, the stalks of which are taken when running to seed, broken off whilst still tender, and eaten raw. In seasons from March to June. We imagine the red-spotted or tinged Cabbage varieties of Lettuce would find favour with consumers of salads, and one of the best of these is the Red Besson, small dark red and brown Geneva.

The large-leaved Spinaches of recent introductions are not yet generally known, but they are great improvements on the old varieties—we refer to the Victoria, Viroflay Giant, and Longstander. In hot, dry soils, where Spinach soon bolts in summer, the New Zealand Spinach, *Tetragonia expansa*, should be cultivated instead. It should be sown in May on ridges of stable-dung and leaves, such as are made for out-of-doors Cucumbers, or on a disused hot-bed. It requires scarcely any attention beyond keeping free from weeds.

In Solanums we have a family of plants limited in the kitchen garden of most establishments to the fiery Chili Pepper, which few persons can consume with comfort, and the usual destination of whose

vinery till the end of June. The plants would succeed under a garden-frame, if planted out on a south border.

There are many more kinds of vegetables, excellent in root, leaf, fruit, pod, or stem, that might be grown in our gardens, only to mention Gourds, Kohl Rabi, Yams, Maize, white and green-seeded Haricots for winter use; numerous Egg-plants; Chicory, Cardoons, &c., that would give added variety to our rather monotonous national cookery.

### BUSH OF NONSUCH APPLE.

MR. WALLIS, the head gardener at Orwell Park, Ipswich, writes:—"I send you a photograph of a

### THE CALADIUM.

THE season has once more come round when stove plants generally receive, at the hands of the prudent gardener, their annual overhauling, which may take the form of top-dressing, re-potting, or, as in the present case, potting-up the tubers. The sight of more than one hundred varieties of Caladiums now making rapid growth in a propagating case at this place, suggested the penning of a few notes respecting their culture. Caladiums are not so extensively grown as they might be, although within the last two or three years the trade and gardeners have taken them in hand extensively, and the run on some of the newer varieties is very heavy, which may be accounted

FIG. 21.—NONSUCH APPLE AT ORWELL PARK, IPSWICH.

pod is the pickle-jar. There are, however, varieties which are devoid of the burning acidity of the Chili, such as the Large Bell Pepper, which is very mild in flavour, has a pod 2 inches long, thick flesh, and few seeds; Bull Nose or Sweet Mountain, a variety of the preceding, prolific, and earlier than it; the Monstrous pepper has pods 6 inches long and 3 wide—mild in flavour, and of a deep red colour; Spanish Mammoth, in red and yellow-podded varieties, is likewise excellent. In this country they would all require for full development some kind of glass protection—even in the height of summer it would be needed—and to be brought on in a

bush of Nonsuch Apple growing in this garden (fig. 21). It is one of three; the oldest was planted thirty-seven years ago, and for thirty seasons it has not failed to carry fruit." The other bushes are of his own working, and about twenty-eight years old. The crop of fruit borne last season by the oldest bush speaks for itself, and it was equally fine in 1894. There are twenty-four of these bushes in the garden at Orwell, and they are some of the surest-cropping Apples there, and the earliest culinary variety, keeping sound till April. The fruits which accompanied the photograph kindly sent by Mr. Wallis fully bore out the words of his note.

for by the fact that many of the more recently-introduced varieties possess much higher colour in the foliage than the older ones, are compacter and dwarfer, which features in themselves justify the popularity they are held in. There exists an impression that many of these newer Caladiums are possessed of a too delicate constitution, and are therefore unsuited for the average uses to which these plants are put. This is a mistaken impression, for given a year or two in which to recover from the weakness caused by excessive propagation at the propagator's hands, I am confident they will be found as serviceable as many of the older forms. Such varieties as

C. Mrs. H. Veitch, C. Louis A. Van Houtte, C. Madame Mitjana, though not exactly new, may be mentioned as illustrating the robust growing, highly coloured sector, which make immense leaves, produce stout leaf-stalks, and are possessed of a robust constitution, making them subjects of easy culture. Another variety may be mentioned in the class of recent introductions, a valuable addition, viz., Baron Adolphe de Rothschild, which is one of the finest yet brought into commerce. Dwarfier subjects include C. Le Nain Rouge, C. Wm. Bull, and C. Adrian.

Of the lighter-coloured sorts, C. Rose Laing stands at the top of the list—a lovely variety, which should be found in every collection; C. Baronne Clara De Hirsch, C. L'Antoine, C. Guil Mar, and the older C. Louise Duplessis. It will not be necessary to mention the useful C. argyrifera, or C. minus rubescens; these are sufficiently well known as to make remarks upon them superfluous.

To increase the stock of any particular variety is an easy matter, from the fact that the *Caladium* does not suffer permanently by being cut into pieces, and every little crown, so to speak, if deftly cut out, and rubbed over with charcoal-powder, and some little time allowed it to get dry, then placed in a thumb-pot, and plunged in a propagating frame, or a clove case in the propagating-pit, where a bottom-heat of say 85° can be depended on, will grow. It is not absolutely necessary to plunge in a case, so far as the main tuber is concerned, but when much cut up the aim should be to produce as big a plant as is possible in the shortest time, hence the need of rapid rooting in a case. The soil on this occasion should consist of loam, peat, and sand in equal parts, the whole being passed through a ½-inch sieve. As soon as these small pots are fairly filled with roots, the plants may be removed from the case and placed on a shelf or bench near the light, when in about a week from this time they may have a shift into 48 or 4½-inch pots, using the soil as before, with one-third of the whole of dried cow-dung added. The crocking should be liberal, as the plants delight in copious supplies of water when in full growth, which should pass off quickly. It will be found necessary to re-pot some of the stronger-growing varieties before midsummer, and this time the soil may be somewhat rougher in texture, and besides adding cow-manure to it, a 6-inch potful of Thompson's vine and plant manure to each barrow-load of soil will do good. The plants should be arranged near the glass, in a bright well-appointed house, if the beauties and contrasts are to be noted; they will require very little shading, and that only during the hottest parts of the day, and the shading stuff should be of a very light texture. The leaves should never be wetted, otherwise spotting of the foliage follows, and eventually the unsightly leaves have to be removed.

I usually grow two batches; one lot grown in 48's are grown on the back stage of a Croton-house having a southern aspect, while the others are placed in 48's, 32's, and 16's; these, after being fairly established in their pots, are placed in the mixed plant-stoves, Fern and other houses, in the summer months, out of which it is easy to draw them for furnishing purposes, thus allowing the main batch to remain untouched. *J. F. McLeod.*

## TREES AND SHRUBS.

### JUNIPERUS RIGIDA.

I much fear that the specific name of this Japanese Conifer is responsible for its absence from many of our parks and gardens. It should, however, be remembered that the name *rigida* has nothing whatever to do with the habit or outline, but directly refers to the stiff, sharp-pointed leaves which render the plant almost as difficult to handle as a bush of Furze. It is at once one of the most distinct, hardy, and beautiful of the many species of *Juniperus*—indeed, I much question whether any other can surpass as a standard specimen a well-grown,

healthy bush of *J. rigida*. It has a warmth of foliage tint, and a gracefully irregular habit, shapely without formality, that renders it one of the most pleasing of small or bush-growing Conifers. Usually it forms a bush of about 12 feet in height, with the diameter of branch spread almost equal from base to tip, the branches slightly ascending, and the branchlets and young shoots gracefully pendulous. A peculiar habit of this species is that some of the branches project further than others, but curiously enough, such branches are so regularly spread over the specimen, that any irregularity of habit is quite lost sight of, and this is further aided by the weeping tips which hang limp and free for several inches in length, and constitute an unusual and distinctive charm. Very beautiful, too, is the silvery sheen of the foliage that is brought about by the conspicuous glaucous furrow that is present on the upper sides of the leaves. Each leaf is half an inch long, narrow, and very stiff, and terminating in a sharp point. At no period of growth is *Juniperus rigida* more beautiful than during the months of June and July, for then the light green (almost of a yellowish tint) of the young growths contrasts markedly with the deep bright green of the older foliage, which later on assumes a warm brownish tint.

For ornamental planting I would place this only second to the better-known *J. recurva*, but it has the advantage over that popular species in that it succeeds well in the very soil where the other becomes rusty and infested with red-spider.

By far the finest specimen that has come under my notice is growing in deep sandy soil near the race-course at Sandown Park; it is 13 feet high, and nearly 5 feet through, and is as perfect a specimen of Conifer as could be desired. *A. D. Webster.*

## THE WEEK'S WORK.

### THE ORCHID HOUSES.

By W. H. WHITE, *Burford, Dorset.*

**SEASONABLE RE-POTTING.**—Owing to the prevailing mildness, many Orchids may have begun to make growth, and the plants should be examined individually, and plants requiring to be re-potted or surface-dressed attended to. In the Mexican-house the bloom is past on *Laelia Gouldiana*, *L. autumnalis*, *L. albida*, *L. Marriottiana*, *L. anceps*, and its varieties, and soon bunches of new roots will issue from the base of the last-made pseudo-bulbs. Immediately this is observed supply fresh materials. Well-established plants in pots or baskets sufficiently large for their needs should not, as a rule, be disturbed at the roots unnecessarily; but should the old materials about the roots have become quite decayed, they should be carefully removed with a pointed piece of stick, and by swilling out the remainder which cannot be conveniently got at. The proper time to choose for doing this operation is when the materials have become dry. The drainage should then be made perfect, and fresh materials afforded. For these plants shallow pans, or wooden baskets may be employed, and in arranging them the leading pseudo-bulbs should be elevated a good bit above the rim, affording a small quantity of the best fibry peat and sphagnum-moss for them to root into. Press the materials firmly together, inserting a few large crocks here and there, so as to render the passage of the water rapid. A good deal of judgment is needed in affording water to plants which have been disturbed in this way, to prevent the decay of the pseudo-bulbs, rhizomes, and roots, more particularly those of freshly-imported pieces; and to guard against this kind of loss much moisture should not be applied till the plants are re-established. For the present, keep the temperature of the house about 55°, by means of the apparatus, and as much higher as sun-heat will carry it, providing the house be well ventilated at the same time, and there is not much humidity therein. When the new growths appear, both heat and ventilation may be gradually increased in amount. Endeavours should always be made by the cultivator to prevent injury to the roots by insects, such as wood-lice and cockroaches, both of which do much harm by gnawing them.

**ODONTOGLOSSUM CITROSMUM.**—In this house the plants of *Odontoglossum citrosimum* may be starting into growth, but they should not be dis-

turbed, the new growths excited by heat or otherwise to make a rapid advance, or they might grow away and produce no flowers at the proper season. Keep them in the coolest part of the house, and afford no water at the root till the flower-spikes show. The leaves on our plants are quite fresh and green, although the pseudo-bulbs are considerably shrivelled, but when the time arrives to supply the plant with moisture, the latter will very soon acquire plumpness.

**INTERMEDIATE-HOUSE.**—The *Sobralias* here are growing fast, and to enable the plants to form strong flowering breaks, will be afforded as much sunlight as possible; with this intent I cut away down to the roots all the flowering shoots of last season, and tie out the young growths wide apart. *Sobralias* need at this season a plentiful supply of water at the roots, and occasionally some mild liquid-manure.

## THE HARDY FRUIT GARDEN.

By G. WOODGATE, *Gardener, Rolleston Hall, Burton-on-Trent.*

**MANURING FRUIT TREES.**—All fruit trees in bearing, or those growing in poor soils, are benefited by having manure placed over their roots at least once a year, and a good time to apply it is as soon as the pruning, &c., is completed. This layer may be from 2 to 3 inches in thickness, and consist of partially-decayed farm-yard manure. This will not exclude air from the soil; and during its rather slow decay, its manurial properties will be carried down to the roots by rain and snow. Whenever practicable, a mulch should be left on the surface, not removed after a time; and if a little attention be paid to putting it on evenly, and lightly smoothing it with the back of the fork, it will have no objectionable appearance, and after a shower or two of rain, will present a clean surface. When the ground is frozen is a good time to mulch, but the work should always be performed without delay after the pruning is finished, so that the adjoining borders may be prepared for cropping. In a soft state of the soil, boards should be used for wheeling on, also on the walks if these are at all soft. If the wall-tree borders are narrow and uncropped, as is usual, the entire space should be mulched, but if these are so wide that a portion of the ground can be cropped, a space 3 feet wide should be lined off, the old mulching removed, together with a small portion of the soil, so as to avoid raising the border above its proper level; the whole 3 feet space should be slightly dressed with freshly slaked lime, a sprinkling of wood-ashes made from the prunings of fruit trees, lightly pointing them in with a fork, and finishing off with a mulch of manure. Pyramids, bushes, cordons, and espaliers growing at the sides of walks should be attended to in the same manner, but making a basin 3 to 6 feet square and 3 inches deep round each tree according to size. The mulch will then be brought to the level of the surrounding soil; and by giving each tree its basin, water during the summer is more efficiently applied, and it does not run off the borders on to the walks. Bush fruit quarters, usually new, require a dressing of soot, at the rate of 1 peck per square rod, before mulching them; and when the space between the rows of bushes is cropped, any of the old spent mulching which is left should be lightly raked on to this portion, the garden line stretched along about 2 feet on each side of the stems, and the enclosed space of 4 feet in width regularly mulched. The alleys may then be dug up in readiness for cropping. All quarters on which the mulching is left the whole year should have a dog space of from 1 to 2 feet in width left as a margin by the sides of the walks, so as to impart a neat appearance, and prevent the mulch being scratched by birds on to the walks. Trees which have borne heavy crops of fruit should receive a dressing of bone-meal and kainit in equal parts at the rate of 4 oz. to the square yard, sprinkling it over the mulching.

## PLANTS UNDER GLASS.

By JNO. MCINTYRE, *Gardener, Woodside, Darlington.*

**WINTER-FLOWERING ZONAL AND OTHER PELARGONIUMS.**—These plants should receive at each alternate watering a weak dose of Peruvian-guano, which is best prepared by putting the guano in a muslin-bag, which should be dipped into the water that is being used, till it has acquired a brown colour. The Ivy-leaved section of *Pelargonium* is also benefited by this kind of manuring. Fancy and show varieties of the *Pelargonium* that were struck last autumn should, by this time, have made good growth, and may be put into their flowering-pots, 5 or 6-inch ones, according to the size and vigour of

the plants. Such sizes of pots confine the roots, and the plant shows flower earlier, and it can always be assisted by liquid-manure when signs of exhaustion appear. Specimen Pelargoniums of these two sections which have been at rest, should be placed close to the glass, in order to get them to break previous to being pruned, re-potted, or top-dressed, as may be required. It is better to annually repot these specimens after they have attained the desired size; but it is not necessary to use larger pots—indeed, rather reducing the size of the ball instead, and repotting in the same sized pot. The best kind of soil for specimen Pelargoniums for show purposes consists of two parts of good rich loam, one part leaf-mould, one part dried cow-manure, the loam being unsifted, but the other ingredients sifted through a half-inch sieve before being mixed with the loam. After potting the plants, lightly sprinkle or spray them once a day, or in bright weather morning and evening. The application of water to the roots will need much care until the roots have permeated the new soil. Previously to potting any specimens which may have been dried off and rested for some time, thoroughly saturate the mass of soil and roots; failing to do this, results in much of the water afforded after re-potting running off into the new soil, little if any of it reaching the middle of the ball.

**CALADIUMS.**—Examine the stock of tubers, selecting those which are new and rare, or of which the stock is to be increased, for starting. Shake the tubers out of the old soil, and put them into 3-inch pots at first, Caladiums being plants that are much benefited by repeated repottings during the growing season. Most of the varieties are good for decorative purposes; and one which is still the best for certain uses, such as dinner-table decorations, filling small vases, or grouping in larger ones for edging a stage, is *C. argyrites*; it goes well with *Adiantum capillus-veneris*. At starting, afford the tubers a bottom-heat of 80°, plunging the pots to the rims in the bed, and withholding water until they are fairly on the move.

**ACHIMENES.**—Some of the tubers of these plants may now be started in boxes or pans filled with peat, loam, sharp sand, and leaf-mould, in equal parts. Place the tubers about an inch apart, and when the stems have grown to an inch or two in height, lift them, and transplant them into baskets, pots, and pans. Place the tubers in brisk heat till growth has become general, when they may come into a warm vinery.

**VENTILATION.**—With the increased temperatures recommended in my previous Calendar, many plants will soon become active, calling for attention on the part of the cultivator. In mild weather, afford ventilation to all kinds of plant-houses, carefully avoiding draughts. Where the air can be admitted to stoves by means of ventilators fixed near the ground-level, and it can be passed over the hot-water pipes before it reaches the plants, there is no difficulty found in ventilating a hot-house; but all houses are not so sensibly built, and the best has to be made of existing contrivances.

### THE FLOWER GARDEN.

By HEDLEY WARREN, *Gardener, Aston Clinton, Tring.*

**HARDY AZALEAS.**—The Ghent and Mollis varieties may now be planted, there being little risk to the plants owing to their lifting with plenty of roots and soil attached to them. When planting them the soil should be made very firm about the roots. Few plants make so fine a show out-of-doors in early summer as these Azaleas, and there is now a great variety of form and colour, and some possess very agreeable fragrance. Although of so much beauty, Azaleas are frequently relegated to some odd corner of the shrubbery, and left to take care of themselves. But they deserve better treatment; for the effect of a group of the plants, when well cared for, is very beautiful seen either at close quarters or at a distance. Planted in ordinary well-drained loam, they succeed and withstand the severest winters; but the position should preferably be a moist one, and not exposed to cold winds. The habit of the plant is not in the least formal, and therefore it looks best at home in beds of regular pattern, and best in informal masses in the wild garden, or grouped naturally in the American garden, or in the woods surrounding a garden. Where the staple soil is not suited to the plant, a mixture of peat, rubble, and coarse sand will grow the Azalea well, and means be taken to ensure free drainage. Beautiful patches of colour may be created in our flower gardens and pleasure grounds by the judicious planting of hardy flowering shrubs in masses instead of isolated single plants, as is too often done.

**BOX EDGINGS.**—These may be relaid only during mild weather. In re-laying Box, take up long sections of the edgings and shorten both roots and tops, and keep moist. Having dug up the soil of the edging, make it firm and level, and incorporate some adjoining fresh soil with it, and proceed to cut with the spade a shallow trench with an upright face, perfectly true. The pieces of Box should be laid in thickly enough to make a close line, even at the top and sides, and raised above the soil about 2 inches. Make each piece firm by the hand, and after putting more soil over the roots by the foot also, finally levelling off with the spade, and throwing the soil not needed on to the bed or border. Whenever a big job of Box laying is undertaken, the gravel, shingle, &c., of which the walk consists, must be shovelled off to a width of 3 feet, and deposited on the opposite side or wheeled wholly away.

**SEEDS FOR PRESENT SOWING.**—Those of *Pentstemon*, *Antirrhinum*, *Verbena hybrida*, *Pyrethrum*, *Parthenium aureum*, *Lobelia*, *Gaillardia hybrida*, &c., may now be sown in a mixture of loam, leaf-mould, and silver-sand, with ample drainage given in the seed-pots, pans, or boxes. These seeds should be covered lightly with the finest soil, and placed in a temperature of 60° to 65°, to be removed when the seedlings appear to a place in the same house nearer to the glass, otherwise very weak growth will be made. Seeds of the alpine *Auricula*, *Polyanthus*, *Carnation*, *Marguerite*, *Hollyhock* and *Dianthus Heddewigi*, may also be sown similarly to the above, but not subjected to a higher temperature than 50° to 55°. It is good practice to place a sheet of shaded glass or paper over the pots or pans in which these small seeds are sown, to be removed as soon as the seeds begin to germinate. *Auricula* seed germinates very slowly, and great care is necessary in not allowing the soil to become dry.

### THE KITCHEN GARDEN.

By C. HERRIN, *Gardener, Droppins, Maidenhead.*

**ONIONS.**—Where it is desired to obtain some extra large Onions either for exhibition or for home consumption, seeds should be sown forthwith in boxes in size about 4 inches in depth, and 1 foot in width, and of any convenient length, putting over the bottom a thickish layer of half-rotten leaves of Beech or Oak, filling the boxes with good loam passed through a half-inch sieve, to which one-third leaf-mould has been added. Before sowing the seeds, make this soil moderately firm; scatter them evenly and thinly on the surface, and lightly cover with fine soil. Place the boxes in a temperature of 55°; a corner of the Mushroom-house is a good place for them, taking care to remove the boxes to a light pit or house on the first appearance of germination having taken place. If the plants are not crowded, they may remain in these boxes, and be gradually hardened-off preparatory to planting them out-of-doors early in April. This early sowing of all Onions in boxes is to be recommended for gardens in which the Onion-maggot is a common pest, as by planting-out plants that are fairly strong, a crop can often be obtained when the weaker seedlings succumb to the attack of the Onion-fly. The now well-known *Excelsior*, *Ailsa Craig*, and *Ronsham Park* represent three good varieties, the two former, of globular shape, are preferred by some gardeners to those having flattish bulbs.

**LEEKs.**—These, if required early in the autumn and large in size, may be raised in the same manner; but for ordinary purposes, the sowing made out-of-doors in March will suffice.

**TURNIPS.**—If frames or brick pits are available, mild hot-beds should be made up, consisting mostly of tree leaves, with just enough fresh stable-dung to start the fermentation; and when the heat is ascertained to be about 80°, and not likely to rise higher, a layer of light rich soil 6 inches in thickness may be put on them, made level and firm, and the Turnip seed sown in drills 8 inches apart, or broadcast. Pay close attention to the bottom-heat, and if it should rise beyond the above figure, means must be taken to let it escape. The top-heat should range from 55° to 58° without sun-heat. Afford air liberally when the plants appear, and thin them when large enough to handle. A broadcast bed or some few drills of Turnips may be sown in a warm spot in the open, so as to form a succession to the crop raised under glass. An early variety, *Extra Early Milan* (purple top) is very good.

**RADISHES.**—A sowing of long or turnip-rooted Radishes may now be made outdoors in a sheltered

position on a south border, or other sunny spot, in the kitchen garden. The soil for this early sowing should be well pulverised, and if it is a tenacious kind, a dressing of wood-ashes and leaf-mould should be thoroughly mixed with the surface-soil. Trample the bed, if the soil is dry enough to allow of it being done, and make firm and level. Sow the seed in drills, made 6 inches asunder, and half an inch deep; and in frosty weather, lightly cover the bed with litter, Russian mats, or bracken, taking especial care to remove it when the sun shines. As a long Radish, *Wood's Early Frame* is still the best; the early scarlet and white forcing Turnip varieties are suitable for this sowing.

**CABBAGE.**—Owing to the prevailing mildness, spring Cabbages are making considerable progress, and I notice that some of *Eltam's Early* are already forming hearts. The growth of weeds is also rapid, and means should be taken to keep them in check. The land may be slightly stirred with the fork, just turning it, and working well up to the stems of the Cabbages; or falling that, drawing some up to them with the hoe after the stirring is finished.

### FRUITS UNDER GLASS.

By W. POPE, *Gardener, Highclere Castle, Newbury.*

**EARLY GRAPE VINES.**—Where these Vines are cultivated in ordinary garden-pots or small tubs, the berries and the bunches also will have been thinned ere this, and the former begun to increase rapidly in size. At such times liquid-manure should be abundantly afforded at a little higher warmth than the air of the house. Sun-heat should be utilised by closing early in the afternoon, but hard forcing by fire-heat alone is not advisable, a temperature of 65° on cold nights being sufficiently warm, with an increase of 5° when the weather is mild.

**SUCCESSION VINERY.**—Early Vines which are planted in borders should not be pushed on quite so hard as the pot Vines; but they may be pushed on rapidly when the amount of sunlight is greater than it is at the present time. If a heap of fermenting stable-litter and leaves has been in use in the vinery it may be removed, and the border dressed with fresh horse-droppings, affording air at the top of the house in the early morning, so that the ammoniacal fumes from the same may escape, otherwise young, tender foliage may get injured. Avoid, however, admitting currents of cold air from without, and guard against wetting highly-beated pipes, both of which are conducive to rusting of the berries. Should the borders be outside ones, and covered with warm leaves and manure, the warmth of the covering should not be suffered to decline, but fresh material should be added as may be required to maintain it. The bunches and berries of advancing crops should be thinned as soon as they are surely set, or have reached the size of *Sweet Pea* seeds. In selecting the bunches which are to remain, give preference to the more compact ones; and when thinning the berries it is better to thin sufficiently at one thinning than to go over the bunches two or three times.

**SUCCESSION VINERIES.**—The warmth in the vineries where the Vines have arrived at the flowering stage should be kept steadily at about 65° at night, any excess of moisture guarded against, and more or less air afforded daily according to the state of the weather, so as to avert the growth of warty leaves and stem-roots. Let shy-setting varieties of Grapes be brushed over at midday with pollen from the *Black Hamburg* or other free-setting variety, or draw the hand gently over the bunches. Great care should be observed in bringing the shoots down to the trellis-wires, which should not be done all at once, but by degrees, and when the flowering is passed they will come readily into their proper place, although it is seldom they can be left so long a time, as they should not be allowed to touch the glass-roof.

**VINES STARTED AT THE NEW YEAR.**—These Vines will now be breaking, and as soon as the bunches can be seen, syringing should be discontinued, a genial moist atmosphere being maintained by damping all available surfaces two or three times a day, increasing the temperature to 55° at night, and 65° in the daytime, with an advance of 10 by sun-heat. The vinery must be carefully ventilated in bright weather, and closed soon after noon. Vines to supply ripe Grapes in July may be closed forthwith, beginning with a warmth of 50° by night, and 55° to 60° by day, the treatment followed being generally that described in these calendars for earlier Vines.

## EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

## APPOINTMENTS FOR FEBRUARY.

SATURDAY,	FEB. 1	{ Isle of Wight Horticultural Association Meeting; Société Française d'Horticulture de Londres meet.
SUNDAY,	FEB. 2	{ Royal Horticultural and Agricultural Society of Ghent meet.
THURSDAY,	FEB. 6	—Lionean Society meet.
SATURDAY,	FEB. 8	—Royal Botanic Society meet.
SUNDAY,	FEB. 9	—Brussels Orchidëenne meet.
TUESDAY,	FEB. 11	{ Royal Horticultural Society Committee Show and Annual General Meeting.
THURSDAY,	FEB. 20	—Lionean Society meet.
FRIDAY,	FEB. 21	{ Royal Gardeneers' Orphan Fund Annual Meeting.
SATURDAY,	FEB. 22	—Royal Botanic Society meet.
THURSDAY,	FEB. 27	—Kew Guild Annual General Meeting.

## SALES FOR THE ENSUING WEEK.

MONDAY,	FEB. 3	{ Azaleas, Pæonies, Phloxes, Begonias, &c. at Protheroe & Morris' Rooms.
TUESDAY,	FEB. 4	{ Orchids, from Messrs. H. Low & Co., at Protheroe & Morris' Rooms. Carnations, Violas, Iris, Lilliums, &c., at Protheroe & Morris' Rooms.
WEDNESDAY,	FEB. 5	{ Lilies from Japan, Importation of Hemerocallis, Begonias, Roses, &c., at Protheroe & Morris' Rooms.
THURSDAY,	FEB. 6	{ Camellias, Roses, Hardy Border Plants, and Bulbs, at Protheroe & Morris' Rooms.
FRIDAY,	FEB. 7	{ Special Sale of Hardy Perennials, Clematis, Pæonies, Amaryllis, &c., at Protheroe & Morris' Rooms. Imported and Established Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—39° 3'.

Horticultural Societies, judges, and schedule-drafters in particular, should be grateful to the Royal Horticultural Society for the publication of the "Rules for Judging, and Suggestions for Schedule-makers, Judges, and Exhibitors." The compilation must have been difficult and laborious. The code now issued, though generally unexceptionable, is sure to have some weak places, but as it represents the work and opinions of so large a body of expert exhibitors and expert judges, it may safely be assumed that whatever defects there may be upon points of detail, the work could not have been done better on the whole.

Moreover, if the committee can be called together at intervals, the code can be gradually improved and brought up to date.

During the exhibition season, that is, from spring till late autumn, we and our contemporaries are continually called on to decide knotty points about judging and the interpretation of schedules. If we have not seen the exhibit it is, of course, almost impossible satisfactorily to answer the question put to us unless it be one of abstract principle. In the case of schedule interpretation we have often to decide between what the framers of the schedule really meant and what they said. We have to take into consideration not only the one isolated phrase in dispute, but the

general construction of the whole schedule, as well as the usual custom. Now, we have at § 8 a distinct pronouncement as follows: "Any exhibits contrary to the wording of the schedule are disqualified." But what if the wording of the schedule be inconsistent? (and consistency, as we shall show, is not attained even in the present code); or, what if the wording leads to absurdities if construed literally, as not unfrequently happens? We mention these matters to show how very difficult a matter it is to draw up a schedule in unequivocal and adequate terms, and what perplexities the committee must have felt in the course of their work. With the code now before us, the task should at least be less difficult, and we, for our parts, shall be heartily glad to be able in future to direct our enquirers to the code. We shall hope to be saved the time and responsibility incurred in giving opinions generally upon unsatisfactory or imperfect evidence.

The title would be more to the point, if it were amended to "Suggestions to Horticultural Societies in regard to the framing of Schedules, with some hints for the assistance of exhibitors and of judges." As it now stands, there is conveyed an imputation of inefficiency on the part of the judges, as if they needed instruction in their work! The compilers of the *Rules for Judging* seem to have had some notion at least of this when they state "It is not however suggested that, in the practical work of judging, the experienced judge will often find it necessary to go in detail through the form of estimating each separate item upon the basis given." (These are the best men to choose.) It may fairly be assumed that there are plenty of capable men who act as judges every season, and for whose services there is a great demand, but whose views might not coincide with those selected to frame these rules now laid down. Are these judges to subordinate their own views to those of the 1896 Code of Rules? The rules are an honest attempt to effect something for the satisfaction of exhibitors, by giving some guidance to the judges employed. The fact, however, remains, that fault-finders and dissatisfied exhibitors will still be found. We have yet to learn that when practical men are employed the fault lies with the judges. It lies rather in the indefinite wording of the schedule, and in non-compliance with the clearing rule at the fixed hour for judging to commence, as well as in allotting too much work for the judges to perform.

It is not by any means the first time the subject has been discussed before the society. We may call attention, for instance, to an excellent paper on the same subject by the late THOMAS MOORE, whose knowledge of plants and of their "points" has never been excelled. Mr. MOORE's paper seems to have escaped the notice of the compilers of the present code, or they would surely have availed themselves more freely of the work and opinions of so highly competent a judge. It is contained in the *Journal of the Royal Horticultural Society* for 1866, new series, vol. i., p. 99. There are, of course, underlying principles beneath the arbitrary arrangements and definitions which, for convenience sake, it is necessary to make; and the less these principles are violated or departed from, the more satisfactory is the result in the long run. Mr. MOORE had a firmer grasp of principles than is evidenced in the present production. We may also call attention to the hints to exhibitors published by Dr. WILLIAMSON, and edited by Mr. MALCOLM DUNN.\*

There is wisely no attempt to define the words "kind" and "variety," but concrete examples are supplied from which we may glean the meanings of the compilers. It would have simplified matters to have abolished the word "variety" altogether. This in botany has a distinct meaning, different from that adapted in the code. If the compilers had laid more stress upon the distinction between "kinds of fruit," "kinds of vegetables," or "kinds of flowers," as general terms, and kinds of Peaches, Apples, Cabbages, Beans, Roses, Chrysanthemums, &c., as specific appellations, they would have avoided the necessity of using the term "variety" at all. If a further distinctive term be really required, the word "sort" might arbitrarily be used to indicate the subordinate differences; thus we might conventionally speak of kinds of vegetables, and sorts of Cabbages and Potatoes, kinds of fruits and sorts of Grapes, &c. As it is, we have Peaches and Nectarines classed as distinct kinds in spite of the fact that the latter is but a bud variation from the former. As neither the word "kind," nor the word "sort," is commonly used in botanical language, there would be no fear of clashing, but in many cases there would be no need of using the word at all.

If, as in the case of such words as "species," "genus," "section," "tribe," "family or order," botanical terms are used, then they should be employed as botanists use them. Else we fall into the same sort of errors as those would do who speak of companies, regiments, battalions, brigades, as being of equivalent meaning and interchangeable. This is one of the commonest and apparently most ineradicable of errors in gardening literature, and we fear the Code will do nothing to improve matters.

The necessity for more precision, difficult as it may be of attainment, is seen, for instance, in § 73, wherein "the Cabbage (Brassica) family is spoken of." Now, except in the vaguest of everyday speech, there is no Cabbage family, and no Brassica family. Brassica is a genus of the family or order Cruciferae, and no one has ever thought of promoting the genus Brassica to the rank of a family. On p. 5 the Cabbage "tribe" is spoken of. It can hardly be a tribe and an order too! For exhibition purposes we are told (p. 10) that Cauliflower, Brussels Sprouts, Cabbage, Borecole, Kale, Savoy and Broccoli, are considered as distinct kinds of vegetables, thus giving to the word "kind" a more restricted signification than that given to it on p. 5, where "kinds" are, with some exceptions, of which this is one, made synonymous with "natural genera." All the plants just named are not only distinct as vegetables in a popular sense, but they are distinct kinds of Cabbage. So in this code, which is to be the guide for schedule-makers, we have the same group called in one place a "family," in another a "tribe," in another a "genus," in another a "kind." This shows how difficult it is to be consistent!

In collections of vegetables, schedule-makers are recommended to word their programme as follows (see p. 5), "Class —, collection of vegetables, six distinct kinds, only one [or two, as the case may be] of the Cabbage-tribe may be included—for, if such a note be not added, the exhibitor would be at liberty to show white Cabbage, red Cabbage, Kale, Savoys, and Brussels Sprouts, as five of the six kinds required." The term *Cabbage-tribe*, would properly include Turnip-tops, but we do not think these were within the intent of the framers of this code. If the distinction between kinds of vegetable and sorts of Cabbage be borne in mind, no such difficulty need arise.

\* To be had at the Society's Office, 117, Victoria Street, S.W.

\* *The Horticultural Handbook and Exhibitors' Guide*, (Blackwood & Sons) New Edition, 1895.

LAKE AT SWINTON PARK, MASHAM, YORKSHIRE.

OVERFLOW STREAM FROM THE LAKE AT SWINTON PARK.

At p. 9, among the models for imitation is also this:—

"iv. Collection of twelve vegetables, not less [fewer] than eight distinct kinds, two of the Cabbage-tribe only allowed." This also raises the doubt whether Turnips would be admitted either as roots or as tops, or in both states. Botanically they would, but we should be puzzled to answer the question off-hand from a "schedule point of view," or from the indications furnished in the Code.

Section 5 requires a little more expansion. It reads thus: "Two or more persons shall not exhibit for prizes separately from the same garden, nursery, or plant-house." This, as it stands, would exclude an Oroid-grower and a fruit-grower in the same establishment from exhibiting. The words "in the same class" seem to have been omitted.

Section 9 contains the wholesome rule that "as regards the relative merit of the exhibits, the decision of the judges is final, but in case of any objection to the interpretation of the wording of the schedule, no prize shall be paid until the matter under dispute has been referred to committee of the show or other authority."

The Council at section 12 undertake their willingness to act as referee in cases of dispute, which is quite as it should be. The gardening papers have, and do this constantly, but they do not get, as the Royal Horticultural Society proposes to do, a fee of 10s. 6d. for the task! At least, they do not. By the way, if there is to be a fee at all, the one proposed is too small.

The definition given of amateur, section 13, is not (perhaps, could not be) satisfactory. It allows, so far as we understand it, a person who sells grafts, or cuttings, or buds, of new seedlings or sports to consider himself an amateur, and permits him to compete with the amateur proper who does nothing of the kind. Surely the line should be drawn so strictly as to exclude all commercial or pecuniary transactions whatever, else there is no end to the doubts and difficulties that arise. One well-known grower was in the habit of distributing broadcast price catalogues of his plants for sale—and yet, forsooth, pleaded, and sometimes successfully, that he was only an amateur! Other tradesmen describe themselves as "amateur nurserymen!" A strict rule coupled with the award of an "extra" prize where deemed requisite, would best meet such cases. So far we have dealt mainly with generalities; we propose, in a subsequent article, to deal with the subject more in detail, and from the point of view of the judge and of the exhibitor respectively.

**LINNEAN SOCIETY.**—On the occasion of the meeting held on Thursday, Jan. 16, Mr. C. B. CLARKE, F.R.S., President, in the chair, Messrs. O. V. APLIN and WILLIAM COLE were elected Fellows of the Society. On behalf of Mr. G. H. ADCOCK, F.L.S., of Geelong, Victoria, Mr. A. B. RENDLE, F.L.S., exhibited and made remarks upon some photographs of *Hakea grammatophylla*, F. Muell., a little-known species of the Proteaceae of local distribution in South Australia (see *Gard. Chron.*, p. 85, fig. 14). Mr. G. F. SCOTT ELLIOT exhibited specimens of bark-cloth from Uganda and the shores of Lake Tanganyika, and gave an account of the mode of its preparation from the Bark-cloth Fig, the fleshy Euphorbia and *Acacia* of British East Africa, illustrating his remarks with lantern slides from photographs taken by himself. Mr. ELLIOT remarked that the native cloth manufactured on the shores of the Tanganyika was made on the same sort of rough loom which he had seen employed near Sierra Leone, and that as the Tanganyika is ethnographically

logically and botanically part of the west coast, it was interesting to find that the methods employed in countries so far apart were so similar in detail. A discussion followed, in which Messrs. RENDLE, HOLMES, T. CRAISTY, and W. CABRETTES took part. On behalf of Mr. W. R. OOLIVIE GAANT, Mr. HASTING exhibited some land shells and eggs and skins of two rare petrels from the Salvage Islands, lying between the Canaries and Madeira. These Islands were stated to be of volcanic origin, faced with steep rocks from 100 to 300 feet in height, and covered with loose sandy soil, the vegetation consisting chiefly of the wild Tomato (*Lycopersicon esculentum*), the Ice plant (*Mesembryanthemum crystallinum*), *Aparagus Scoparius*, and *Cistanche lutea*. A paper was then read by Professor T. RUPERT JONES, F.R.S., and Mr. FREDERICK CHAPMAN, on the "Relations of the Pistulose Polymorphisms and the Ramulinae," with the view of showing the existing evidence for or against the suggestion that several specimens referred to the latter of these two sub-families may really belong to the former.

— An evening meeting will be held [on Thursday, February 6, 1896, at 8 P.M., when papers will be read as follows:—I. "On Polytelic roots of certain Palms," by Mr. B. J. CORMACK. II. "On a Remarkable use of Ants in Asia Minor," by R. MORTON MIDDLETON, F.L.S., &c.

**DR. MORRIS, C.M.G.**—It is gratifying and inspiring to hear of the Assistant Director unfurling the flag of Kew, if we may so speak, not only in our colony of Bahamas, but in New York itself. Dr. MORRIS turned a winter holiday to account by visiting the Bahamas with a view of developing the vegetable resources of the colony, and of promoting the culture of the valuable Sisal Hemp. His lectures were attended by the Governor and the leading citizen, and there can be no doubt that good results will follow. In New York, a descriptive and illustrated lecture was given on the Royal Gardens at Kew, which was specially appropriate, in view of the establishment of a similar institution in the vicinity of New York. Dr. MORRIS, it appears, visited the proposed site, expressed his approval of it, and took the opportunity to wish God speed to the enterprise on the part of the botanical institutions of the Old World. Before leaving the city, he was entertained at dinner by the President and members of the Torrey Botanical Club.

**RAILWAY RATES FOR FARM PRODUCE.**—A correspondent of the *Times* writes:—Will you permit me to give you my experience of the recent reductions so loudly talked about in railway charges for farm produce? I ordered from a farmer at Upminster, Essex, fifteen miles from London, 1 cwt. of Potatoes, to be delivered in Croydon; they were sent through by the Great Eastern and Brighton railways, and I was charged for carriage 2s. 6d., just the price of the Potatoes. I then ordered 1 cwt. from a farmer at Ilford, eight miles from London, to be sent to Croydon; he sent them through by CARTER, PATESON & Co., who charged for carriage 9d. How can such a difference be justified?

**ROBERT DOUGLAS.**—The *National Nurseryman* gives a portrait and a sketch of the career of this gentleman. He was born at Gateshead in 1813, migrated to the States in 1836, and located permanently at Waukegan since 1844. Mr. DOUGLAS has been an enthusiastic and judicious planter, and is widely renowned for his knowledge of Coniferous and other trees.

**THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.**—Among the numerous gathering of friends of the institution present at the friendly supper which took place at the termination of the annual meeting, were the honorary secretaries of the Bath and Bristol and Worcester auxiliaries. The hon. secretary for the last-named town brought a cheque for the sum of £85, contributed by that branch to the parent institution. It also transpired that a friend of the charity, having connection with Covent Garden Market, had given a donation of £32 11s.

(thirty-one guineas), for the purpose of seeding one guinea to each of the thirty-one unsuccessful candidates.

**RIPE CRANBERRIES IN JANUARY.**—"I have just seen," writes an Aberdeenshire correspondent on Saturday, 25th ult., "a spray of the Cranberry plant, bearing a number of perfectly grown and ripe fruit. They were pulled by Mr. JOHN GRAY, Boghead, Birse, —up Deeside, some 50 miles from Aberdeen—near the roadside in the Forest of Birse. The ripening of this fruit at this time of the year is phenomenal, as Cranberries are generally ready for pulling about the month of August. The phenomenon is certainly illustrative of the mildness of the season."

**A CAUTION TO GARDENERS.**—We desire to warn gardeners, especially those looking out for a situation, against the wiles of a man travelling in the neighbourhood of London who gives the gardener to understand that he has the filling of a situation as head gardener at such and such a place, always fictitious; and then under some plausible pretext extracts money from him. A case has lately come to our knowledge in which a vacancy was stated to have occurred at Hook Hall, Basingstoke.

**DOUBLE COCOA-NUT.**—Mr. FLETCHER, of Warrington, kindly sends us a photograph of this extraordinary Palm in process of germination. From Mr. G. S. Jenman we have also received a similar photograph, so that we may infer the germination presents no special difficulties. We should gladly have engraved one or other of these illustrations, were it not for the fact that we have repeatedly figured the Palm as growing at Kew.

**VEGETATION IN THE SOUTH OF SCOTLAND.**—A correspondent writes:—"The Rhododendrons at Logan House are at present in bloom. The China Roses in my garden have produced flower-buds within the last fortnight; and I have found several, newly formed, on A. K. Williams, one of the finest of the hybrid perpetuals."

**A £50 PRIZE FOR THE BEST FRUIT AND VEGETABLE DRYER.**—Through the Bath and West of England Agricultural Society, which will hold its annual show at St. Albans from May 27 to June 1 next, the proprietors of the *Ironmonger* newspaper, London, offer a prize of £50 for the best machine for fruit and vegetable drying. It is hoped that this offer may have the effect of bringing forward a machine which will enable our fruit and vegetable growers to dry their products, and so realise a much higher price for them than they commonly do now that the universal practice is to glut the markets with all kinds of fruit directly it is ripe. Full particulars of the competition will be supplied by the Secretary of the Bath and West Society, Mr. T. F. PLOWMAN, 4, Terrace Walk, Bath; and the machines will be tried and judged at the St. Albans show.

**THE SURVEYORS' INSTITUTION.**—At the ordinary general meeting, held on Monday, January 20, a paper was read by Col. G. W. RAIKES (Fellow), entitled "The Re-apportionment of Rates and Taxes." A discussion followed, and was concluded, and a vote of thanks was unanimously passed to Col. RAIKES for his paper. The next meeting will be held on Monday, February 3, 1896, when a paper will be read by Mr. R. F. COLAM (Associate), entitled "An Improved Method of Settling Disputes as to Rights of Way." The chair to be taken at 8 o'clock.

**READING AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.**—The first of the series of meetings for the new year was held in the Abbey Hall, on Monday, the 27th ult., when the newly-elected president, Mr. A. W. SUTTON, invited the members and their wives to tea at 6 o'clock, the party numbering 170. The tables were tastefully decorated with Palms, Ferns, &c. Amongst those present at the tea and entertainment were Mr. and Mrs. A. W. Sutton, Mr. Leonard Sutton, Mr. Hubert Sutton, Mr. Neve, the chairman of the association; Mr. Burton, vice-chairman; Mr. J. Pound, Jun.,

hon. secretary; Messrs. Martin, Woolford, Bowie, Ontram, Turton, Dockerill, R. Webb (Beenharn); Townsend (Wellington College); Williamson (Wokingham); Wise (Blackwater); Dearlove (Burghfield); Barefoot (Mortimer); Johnson and Hatt (Egglefield) Osborne (Sonning); Barton (Bexley Heath), &c. The president, who was received by prolonged cheering, expressed the very great pleasure it had given him to accept the post of president for the present year, and promised to do everything in his power to further the interests of the association during the coming season. Mr. Sutton also promised to repeat his lecture on Potatoes read before the Royal Horticultural Society, if the secretary could find a suitable evening for it.

**ESLING HORTICULTURAL SOCIETY.**—The annual meeting of this society took place on the 24th ult. The report stated there was great need for an increased amount of subscriptions, and by way of bringing increased support the committee hoped to offer special prizes, open to all comers, and to form a reserve fund. The last summer exhibition at Gunnersbury Park was scarcely so full as usual, as owing to the dry weather there was a falling off in the classes for fruit, flowers, and vegetables. The financial statement showed a balance on the year of £28 15s. 4d., though the takings at the Chrysanthemum show fell below the usual average. It was resolved to offer a series of special prizes, open to all comers, with a view of providing additional attractions. The next summer show will be held on July 1, in the grounds of Hanger Hill House, Ealing.

**ESLING DISTRICT GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.**—This newly-established suburban society encourages the reading of papers on horticultural subjects; embodying original research, at its weekly meetings, held during the winter months; and as affording a stimulus to its members, Mr. W. W. RICHARDSON offers three prizes for an essay on the cultivation of Roses in the open air; and Mr. J. HUGHES an equal number for an essay on the Chrysanthemum. The Honorary Secretary is Mr. W. ROBERTS, Braemar Gardens, North Common Road, Ealing.

**PEOPLE'S PALACE HORTICULTURAL SOCIETY.**—One of the course of monthly lectures delivered before the members of this society was given on Saturday, January 25, by Mr. R. DEAN, who took for his subject, "Preserved Flowers and Grasses and their Uses," a number of examples in the way of grasses and flowers having been furnished to illustrate the subject of the lecture by Messrs. OSMAN & Co., Commercial Street. There was a large and attentive audience.

**FERN STEALERS.**—WILLIAM MOBEY and CHARLES WILLIAMS, of Bexley, Kent, were charged at Totnes with damaging Devonshire hedges. The evidence went to show that prisoners were engaged with a horse and cart in the wholesale removal of Ferns, about 5 cwt. of roots being found in an outhouse. Previous convictions were recorded, and the Bench inflicted fines—MOBEY, £5; WILLIAMS, £2 10s.; together with the amount of damage. The money not being forthcoming, MOBEY was sentenced to six weeks' hard labour, and WILLIAMS to one month.

**HIGHGATE CHRYSANTHEMUM SOCIETY.**—The eleventh annual meeting of members was held on the 22nd ult., Mr. C. CATLING, the President, presiding. The annual report stated that the exhibition held in November was exceptionally good. The special prizes offered by the President and Mr. W. BECKETT for groups of Chrysanthemums were well contested, and constituted a leading feature of the show. The financial statement showed that the year was commenced with a balance in hand of 6s. 5d. The total amount of receipts for the year was £121 6s. 8d. The chief item of disbursements was £70 8s. for prize-money, and after all expenses had been met, there remained a balance to the good of 19s. 8½d. Votes of thanks having been given to the retiring officers, the election of officers for 1896 was proceeded with, and the Chairman proposed as

President, Mr. H. W. BIAKS, whose name was adopted with unanimity. For the posts of Treasurer and Secretary, Mr. J. W. KEARSON and Mr. W. E. BOYD were re-elected; as were also Messrs. G. ATKINS and G. W. SMYTH as auditors. The exhibition for the present year has been fixed for November 12 and 13.

**DEVON AND EXETER GARDENERS' ASSOCIATION.**—At a meeting of this Association, held in the Guildhall, Exeter, on the 22nd ult., a paper on "Fruit Culture, with special Reference to the Selection and Cultivation of Small Fruits," by Mr. BERRY, was read by Mr. HOPE, Hon. Secretary. In the discussion that followed, it was thought that some of the experiences gained by the author when in the East of England, had but little application to the more humid climate of Devonshire. It was agreed, however, that the paper conveyed many excellent hints upon the cultivation of these smaller or bush-fruits.

"THE JOURNAL OF THE ESSEX TECHNICAL LABORATORIES" shows how admirably the directors of those establishments understand the requirements of the times. The combination of thorough grounding in principles and of manual training in the practice of agriculture and horticulture, cannot fail to produce excellent results in the future. In principle we cannot imagine a better training for beginners than is afforded under the auspices of the Essex County Council, supplemented by further experience in a good garden.

"AMERICAN GARDENING."—The number for January 4 possesses peculiar interest as being a jubilee number. The auspicious event is celebrated by the adoption of a weekly instead of a fortnightly issue. During the fifty years that have elapsed the journal has many times changed its name and its editors. As the *Horticulturist* it was founded by A. J. DOWNING, a name held in honour on both sides of the Atlantic. PATRICK BANAY succeeded in the editorial chair. In 1858 it was merged into the *Gardeners' Monthly*, edited for years by another famous man, THOMAS MEEHAN. On the death of the publisher, the *Gardeners' Monthly* was incorporated with the *American Garden*. The paper indeed seems to have undergone a series of changes, now being amalgamated with this one, and again, Amceba-like, engulfing that. It is rather puzzling for us to follow all these changes; it must suffice to say that Dr. HEXAMER was once editor, and that under the title *Popular Gardening* it was under the editorship of Professor BAILEY, one of the foremost men in his department. Him succeeded our former collaborator and our present friend LEONARD BARRON. The changes he has introduced have been evidently beneficial, and we look forward with something like paternal interest to the future progress of *American Gardening* under his direction. It is significant of the identity of national stock to note that there have been and are many English-born editors of American gardening periodicals. On our side we are always glad to welcome American correspondence and American co-operation. Among literary and scientific men the difference of nationality is for the most part practically ignored. Who that knew him personally, ever thought, for instance, of ASA GRAY as an American?

**THE CURATOR FOR THE SIERRA LEONE BOTANIC GARDEN.**—For the newly-established Botanic Garden at Sierra Leone, Mr. FREDERICK ENOS WILLEY has, according to the December *Kew Bulletin*, been appointed as curator. Mr. WILLEY has been in the employ of the Kew Gardens for some three years, part of which time was spent by him as curator of the botanic station at Abusi, Gold Coast, during the absence of the late Mr. CROWTHER. Mr. WILLEY's manifested skill and experience are recognised by his appointment by the Secretary of State for the Colonies to this new post.

**PUBLICATIONS RECEIVED.**—We have received vol. x. of the *Proceedings and Journal of the Agricultural and Horticultural Society of India*, July—Sep-

tember, 1895. This contains, Some notes on the sacred flowers of the Hindus, a Report on the manufacture of Tea in Assam, and other papers.—*Bulletin of the Botanical Department, Jamaica*, for December, 1895, including notes on Coffee and its cultivation and curing; Badding Orange Trees, by W. CRADWICK; Packing Oranges; and Synoptical List of Ferns (continued).—*Bulletin of Miscellaneous Information*, from the Royal Gardens, Kew, for December, 1895, including articles upon cultivation of vegetables, Decades Kewenses (description of new plants), and miscellaneous notes, among which is a curious note on the fate of the great Screw Pines at Kew, including a reference to an account of a similar calamity in the Breslau Botanic Garden, drawn up by Professor CORN; and a like disaster at Glasnevin. The cause of the disease is a fungus—*Melanconium Pandani*.—*Culture of the Chrysanthemum*, by W. WELLS, Earlswood Nurseries, Redhill; price 1s.

## BELGIUM.

### THE EDITORSHIP OF THE *LINDENIA*.

M. A. COGNIAUX, the well-known Belgian botanist, has undertaken, from the beginning of the present year, the editorship of the *Lindenia*. Our correspondent, M. Ch. De Bosschère, takes charge of the editor's department of the *Illustration Horticole*, on the 30th of each month; that for the 15th will be retained by M. Rodigas. M. Lucien Linden, who is at the head of three large horticultural establishments, finds himself obliged to relinquish the editorship of these publications, of which he is the proprietor and director.

### NOTES FROM HEYTHROP PARK.

On January 15, the usual annual ball at Heythrop, the country seat of Mr. A. BRASSEY, M.P., took place, and at such times a great floral display is to be found in the gardens. A few days before the event took place, a visit paid to the glasshouses showed some excellent white Butterfly Cyclamen, two-year-old tubers, in 32-sized pots, one of which I counted 150 fully-expanded flowers, of good size and substance, which I should think would bear comparison with the German strain. The Poinsettias were a grand lot of plants, with heads of bracts measuring 18 inches in diameter; the plants about 3 feet high, with foliage down to the pot. About 200 Poinsettias are grown. Calanthes are well cultivated, and these consist of *C. Veitchii*, *C. V. rubra*, and *C. V. aurea*, the flower-spikes of *C. Veitchii* measured more than 3 feet in height, the flower of good size and colour. Euphorbia jacquiniiflora is largely grown. Among the Orchids, I noticed some excellent pieces of *Cœlogyne cristata*, three plants each measuring 3 feet through, were masses of open flowers. Other Orchids in flower were *Dendrobium Wardianum*, *D. nobile*, *Phalanopsis Schilleriana*, *Lycaste Skinneri*, *Saccolabium giganteum*, *Dendrochilum glaucum*, and some good pots of *Sophranites grandiflora*. Here, too, are two of the finest plants of *Adiantum Farleyense* I have ever seen; they are 4 feet high, and as much through, and the picture of health. Growing in the same house is a fine specimen of *Anthriscum Scherzerianum*, fully 4 feet through, very healthy, and free flowering. Winter-flowering Begonias, double-flowered Primulas, Hyacinths, Narcissus, Mignonette in small pots, and as specimen plants; large specimen plants of Lilacs, *Viburnum opulus*, *Dentzia cantoniensis*, *Rhododendron Princess Alice*, *Azalea indica*, *A. mollis*, and *A. amœna*, &c. Violets, both in pots and frames, are quite a feature of the place, and the frames number twelve lights, and the pots about 150. The demand for Violets for buttonholes is very large, Marie Louise and Swanley White are the varieties grown. In the conservatory, a fine specimen of *Luculia gratissima*, as much as 12 feet high, was just coming into flower. Everything about the gardens bears witness to careful, painstaking cultivation. C. Collett.

### VIEW IN MR. ARDERNE'S GARDEN.

We have already given illustrations of the manner in which ornamental plants grow in the beautiful gardens of Mr. Arderne at Cape Town. The view we now give (fig. 22), shows a broad border filled with the very lovely white-flowered *Watsonia O'Brieni*. This is one of the most beautiful flowers of its class, and the way in which it has been grown in the open at Kew shows that we are not debarred from its cultivation in this country.

### HOME CORRESPONDENCE.

**GARDENERS' ROYAL BENEVOLENT INSTITUTION ELECTION.**—I was sorry to read Mr. Findlay's note (p. 116) respecting the Gardeners' Royal

North, will not deny others the benefit of the same influence, even if it does run contrary to his channels. Before this sort of thing can be done away with, those carpens whom Mr. Findlay hints at in his preface will have to come in, and after getting rid of the present race on earth, will "at the beginning" be careful to have a pure pair to start with, and ensure their keeping so. In making these remarks, I do not infer that the non- or short-subscribing candidates who get on the fund at the annual elections are always the most deserving; while human nature remains what it is, we shall not get an ideal perfection in this or any other matter. To me the saddest portion of Mr. Findlay's note is where he infers that unless the rules are altered, as he suggests, he will refrain from asking gardeners to subscribe in the future. I venture to assert that those gardeners who follow his leading in this respect will in the long run be the only real sufferers. Personally, I have not done nearly so much for the Institution as Mr. Findlay, not having his influence and position.

It was after thinking this matter over that I decided to become *A Subscriber*.

— I am sorry to say anything against what Mr. Bruce Findlay advances on any subject, but his remarks on the Gardeners' Royal Benevolent Institution, see *Gardeners' Chronicle*, p. 116, January 25, seem to call for special notice. He seems to have entirely missed his mark—the Gardeners' Royal Benevolent Institution is not a benefit society, nor ever has been. I, as one of the committee, suppose that I know something of its working, so I may as well say at once that we could not give the pensions to 158 persons if we had to depend on the subscriptions of gardeners alone. If Mr. Bruce Findlay or anyone else will kindly take the trouble to go through the annual report, it would soon be discovered what a number of pensioners would have forthwith to be told their pension had ceased, if the pensions depended on the contributions of their brethren alone. The worst of it is,

FIG. 22.—*WATSONIA O'BRIENI* IN THE GARDENS OF H. M. ARDERNE, ESQ., CAPE TOWN.

Benevolent Institution, for it is well known that that gentleman has long been a subscriber to it, taking a personal interest in its well-being. I fear that like some of the rest of us, he is a bit disappointed at not getting his non- or short-subscribing candidate on to the pension list. I say non- or short-subscribing candidate advisedly, as even Mr. Findlay knows full well that all candidates who have subscribed over fifteen years, and are otherwise eligible, are put on without an election. Those who have not subscribed long enough, have votes allowed them *pro rata* to the time they have done so. I for one cannot agree with his proposal, that only subscribers to the fund should be put on the pension list. This is striking a blow at the root of the Institution, which is a benevolent one, not a benefit society in the strict sense of the term, though it is such in reality, as no election takes place until all eligible subscribers are put on. Surely, Mr. Findlay, whose well-known personal influence has done so much in the past for horticulture in the

Still, I have done a little to help its funds by word and deed, and feel I can still conscientiously ask all my non-subscribing fellow gardeners, on the grounds of self-interest, if for no other motive, to become subscribers. I would say, do this in good time, and then if you need its help you are certain to get it, without the trouble and uncertainty of an election. The rules are plain enough in this matter—he who runs may read, if he will. As bearing on this matter, allow me to mention an incident told me (in confidence) over sixteen years ago by the late energetic secretary, Mr. E. R. Cutler. Some thirty years ago, he (Mr. C.) wrote to a gardener then occupying a good position in the gardening world, pressing him rather closely to become a subscriber to the "Benevolent." He received a very offensive reply from the person in question. Some years later this said gardener called on Mr. Cutler at his office in London begging him, with tears in his eyes, to do all he could to get him on the pension fund. Both persons are now dead.

that for some cause, which I have failed to discover, a large number of those gardeners who, in the heyday of their health and strength and unsilvered hair, were the loudest in their denunciation of the management of the Gardeners' Royal Benevolent Institution, are the first to apply for its benefits when they find their strength failing, and their days of active work are nearly over. They then come and pay £10 down, or for a few (a very few) years, pay an annual £1 1s, and expect to be put on at once, and so to get back the very first year two or, it may be, three times as much money as they have subscribed. If the gardeners who will not pay a penny in subscriptions, will only look down the list of pensioners, they will find many names of men who once scarcely ever had a good word to say about the Royal Benevolent Institution for gardeners. *W. Denning, Heathfield Nursery, Hampton, Middlesex.*

— As an old subscriber to this excellent Institution, I regret to read Mr. Bruce Findlay's letter (p. 116).

I know of no kindred society that gives so much to subscribers who need assistance for so little subscribed, and the amount paid in the shape of pensions is out of all proportion to the subscriptions received from gardeners. On the 16th inst., out of fifteen successful candidates, five were placed on the list of pensioners without the trouble or expense of election, simply because they had been subscribers; and out of the remaining ten who were elected, two only had not been subscribers, one aged 73, and the other 81, who had been a gardener nearly all his life. If the benefits of the Institution were to be restricted to those only who have been subscribers, it would, in my opinion, degenerate, and fail to receive the support that it has had in the past. Legacies have been left, and large sums given on the faith of existing rules, and the Institution has been enrolled under the Friendly Societies' Act. It would scarcely be just to limit the voting power in the manner proposed. It is not the case that a non-subscriber can be nominated over the heads of those who have been subscribers. These are credited with votes according to the number of years they have subscribed, and thus start in their candidature with an advantage over those who have never subscribed. Having had much experience with charitable institutions, I know that some candidates appear to have powerful friends, when, in fact, it is their distress that has gained them. *W. Ronpell.*

— Your Manchester correspondent has "hit the right nail on the head" in his pithy remarks re the above valuable Institution, and unless the abuse complained of is removed, and none but subscribers—and those who have subscribed the longest have the prior claim—be eligible for election as pensioners, a great injustice is done, not only to those who, in or out of situation, have continued, and often at great self-denial, their subscriptions, but also to the Institution itself. Already a great difficulty is experienced in getting young gardeners to subscribe, for the very reason of the favouritism complained of. It certainly does seem hard, to say the least, that such an abuse should be practised that those who have never subscribed should become pensioners of any benevolent institution, and I trust now the subject has been ventilated, subscribers will not let it rest until the abuse is removed. *A Subscriber of Sixteen Years.* [We would advise our correspondent and other cavaliers to carefully read the remarks of *W. Ronpell*, *W. Denniog*, and "Old Subscriber," in the present issue, for the purpose of obtaining exact statements of the aims and objects of the Institution. *Ed.*]

— I was glad to see the letter over the signature of Mr. Bruce Findlay with reference to the practice of soliciting votes for candidates for the pension. The perusal of the list of candidates must leave a strong feeling of regret in every one to know that so many of them, poor and deserving as they evidently are, will have to wait at least another year for the pension that will help to brighten and cheer the last days of their lives. But that feeling is intensified when we learn that subscribers of ten, eleven, and twelve years respectively have been unsuccessful, and the pension has been awarded to some who have been indifferent to their own welfare as well as to the well-being of the Institution. I am not prepared to endorse Mr. Bruce Findlay's remedy for the evil, serious as I consider it to be. There have been years in the past, and I have no doubt there will be times in the future, when there will be funds sufficient for all; and I think if subscribers generally will only give the matter their serious consideration, they must see how unfair it is for people of high position in the horticultural world to use their influence in favour of any one candidate, however deserving he may be, unless they know there is not another in a still worse plight. Perhaps there will always be a few who are anxious for the success of their friends, and in kindness of heart will do their best to help them. But if the majority of the subscribers will refrain from pledging their votes until they see the full list of applicants, and will then give their votes to those who have tried to help themselves and their brothers, we should not then have to regret that many of the most deserving have to apply again and again for help. *George Burt.*

— Before reading Mr. Findlay's remarks on the above institution, similar thoughts had occurred to me, and I quite agree with what he says on the subject, that none but subscribers should be eligible for election as pensioners; it is not right or just for a non-subscriber (who probably in his palmy days thought the institution beneath his notice) to be elected over the heads of men who have been sub-

scribers for some years; and I for one shall not give my votes to a non-subscriber so long as there are subscribers eligible for election, of which there generally are more than sufficient. *J. Wallis, Keele Hall Gardens.*

— It may interest many of the supporters of this valuable Society to know that in the year 1856 the anniversary meeting of the Society took place in the rooms of the Horticultural Society, 21, Regent Street, on January 16, the late Mr. George Paul being in the chair; the total income then being £824 5s. 6d., made up of annual subscriptions, £547 1s.; donations at the annual festival in the previous year £181 12s.; and dividends on stock, £95 12s. 6d. When these figures are contrasted with those presented at the annual meeting recently held, some idea can be gained of the growth of the Society during the past forty years. Pensions had been paid amounting to £442. £300 worth of 3 per cents. had been purchased for £2692s. 6d., and the total expenditure amounted to £876 8s. 8d.; at that time the amount invested was £3700. At this meeting, Mr. John Lee was elected a trustee of the society. On June 11, the anniversary festival was held, Sir Joseph Paxton in the chair; the donations amounting to £270; and on July 9 there was an election of two pensioners out of sixteen candidates. *R. D.*

**AQUILEGIA SKINNERI.**—I read with much interest Mr. Wolley Dod's note on *Aquilegia Skinneri*, as I have for nearly twenty years tried to obtain the type of this species, but without success. The plant which we have in our garden under this name is only *A. canadensis*, with longer flowers, and a more slender and erect habit. I have never had any other, and had begun to question whether *A. Skinneri* were not a myth. But this is what complicates matters. I have grown since 1884, and under the name of *A. arctica*, *Hort. Loudon*, a Columbine with red flowers, answering to the description that my friend, Mr. Dod, gives of *A. Skinneri*, as obtained by him from seed from Mr. Thompson. This *A. arctica*, *Loudon*, is *A. formosa*, Fischer (in *D. C. Prodr. Rom.*), and a good coloured figure of it is to be found in the *Flore des Serres*, by Van Houtte, t. 8. It comes from eastern Kamtschatka, and flowers at the end of July, as did Mr. Wolley Dod's *A. Skinneri*. May not this be the same plant? Is *A. formosa* identical with *A. Skinneri*, and does it grow in Kamtschatka or in Mexico, or if it grows in both places? Or are they two different species, and, if so, what are the specific characteristics distinguishing each of them? *H. Correvon, Geneva.*

**EUCHARIS GRANDIFLORA AT THE GARNONS, HEREFORD.**—A thoroughly healthy batch of this plant, quite free from mite and mealy-bug, with broad, dark green, stiff foliage, and plenty of flowers, on about a hundred plants in pots, varying from 7 inches to 12 inches, is a grand sight; and it may be of interest to others to know that Mr. Fox, the able head gardener, keeps them always growing. The plants were potted three years ago in a mixture of three-quarters good loam, one-quarter charcoal and sand, and the bulbs covered fully 2 inches. During summer they get a good syringing twice a day, and an occasional syringing about now. Water is given rather sparingly just now, but in the growing summer time heavy watering is afforded, and also once a week some weak liquid-manne. *W. E.*

**RHODODENDRON ARGENTEUM.**—During a recent trip round the Dukeries, I was much struck with a fine tree of *Rhododendron argenteum*, which I found growing in one of the houses in the excellently-kept gardens attached to Osberton Hall, near Worksop, the residence of the Right Hon. F. J. Savile Foljambe. This tree measures about 14 feet high, and would doubtless grow much larger did not the dimensions of the house unfortunately necessitate its being cut-back; it is now in full bloom, and is literally one mass of huge trusses, each truss consisting of from eighteen to twenty-two flowers. The milky-white colour of the blooms with their deep claret splash present a truly magnificent sight. Mr. T. H. Crasp, the head gardener at this establishment, has been moving a lot of large old fruit trees with conspicuous success, and although the present is usually regarded as a "rough" time in the garden, at Osberton everything will be found as neat and bright as the proverbial new pin. *A. J.*

**MECHANICAL MOTORS.**—I have read with much interest and some amusement Mr. Lawson's letter, on p. 116, concerning the use of mechanical motors in gardens. I quite fail to see the force of his arguments against them. His objection to their

noisiness applies equally to the lawn-mowers and rollers commonly employed. Probably the new motor would do the work so much more expeditiously that a longer daily period of quietness and peaceful enjoyment of the garden would be possible. I cannot see, either, how a person accustomed to hauling a roller or walking between the handles of a lawn-mower would be lowering his position by tending a mechanical motor; indeed, if he became expert in the latter occupation he would have made a distinct advance in usefulness and intelligence. The motor, not necessarily a noisy smoke-producer, would have the advantage over an animal-propelled machine of not damaging the turf by hoof-prints, and could, for that reason, be worked in weather that would forbid the use of horse or pony. As a gardener of over forty years' practice in fairly large establishments, I hail with satisfaction the prospect of the use of these motors in horticulture. *G. D., Hawkhurst, January 25.*

**A TRADE GARDENER'S REQUIREMENTS.**—I think that the letter which appeared in the last issue of the *Gardeners' Chronicle*, under the above heading, will have caused considerable amusement and some sensation to those who read it, and who may be connected in any way with the gardening fraternity. It is a great pity that your correspondent did not answer it, so as to have got a reply, stating what wages he would receive if he possessed all the above qualifications, viz. bricklayer, glazier, painter, architect, designer, clerk, market-gardener, company-promoter, &c. &c. Had ever one man possessed a knowledge of all these trades and professions, if so, his annals ought to be recorded in the lives of famous men, and be certainly ought to rank higher than any cabinet minister, or military or naval hero. But how often do we see in the advertising columns of the gardening papers men wanted to fill so many positions, and yet called gardeners. Only recently there appeared in the *Gardeners' Chronicle* an advertisement requiring a man with good knowledge of Orchids and crows; or a young journeyman, or improver, with a fair tenor or bass voice, to join the church or chapel choir; indeed, the requirements are given in endless variety, and the payment made is a sum of 16s. per week, and perhaps a botch. *Foreman.*

**THE ROYAL HORTICULTURAL SOCIETY.**—There are occasions when it may be well to break a wholesome rule, and write a word about one's self, as, for instance, in answer to the letter (p. 115) of "A Horticultural Fellow of the Royal Horticultural Society," because this writer is disparaging not myself only—a matter of little consequence, but a large number of the amateur Fellows of the society. The disabilities which be thoughtfully assigns to me, and so to very many of the Fellows, are these:—1. I am a clergyman; 2. I live "in a rural district of Hampshire;" 3. I am a member of the Scientific Committee. To consider these objections one by one. 1. It has hitherto been reckoned a matter of historical fact that the clergy have, perhaps, shown more interest in horticulture than any class of men not professional gardeners, and that some of them have even attained to eminence in this branch of knowledge. From the every-day practical point of view, they have opportunities, which they largely use, of spreading the love and knowledge of gardening. Lastly, they form a not inconsiderable part of the society. 2. It is, doubtless, a mark of inferiority and a disqualification to live in a "rural district," and the activity of the country Fellows should be strictly limited to the punctual payment of their annual subscriptions. Yet even we provincials and rustics have gardens, read books—nay, even write them sometimes—and have been known to visit London. 3. It will not be intuitively clear to every reader of the *Gardeners' Chronicle* that ignorance of practical horticulture follows as a necessary logical sequence from membership of the Scientific Committee. We must await a further demonstration of this truth from the "Horticultural Fellow," whom I will not, by the same reasoning, call unscientific in his argument because he is horticultural. Antibiographical memoirs are the fashion, so I will not ask pardon for saying that I have given the leisure of a great part of my life to a kind of horticulture which I consider practical, that I have been for a dozen years a Fellow of the Royal Horticultural Society, and have served on the Scientific, the Floral, and the Narcissus Committee, and that for two years I have been a lecturer on horticulture under the Wiltshire Technical Education Committee. But whether it has been my fortune to "render services to practical horticulture which qualify &c.," it is

not for me to say. I can only say that, when asked, quite unexpectedly, to let myself be nominated for the Council of the Royal Horticultural Society, I willingly, as many another rustic would do, consented to face the considerable trouble and expense which my possible election would entail, if only I could be of any service to the Society, and to the advancement of horticulture in general. I do not know what the "Horticultural Fellow" means by practical horticulture, and am not sure he knows himself. I commonly dig in my own garden, but have not yet qualified myself by digging in his. It is noticeable that this writer desires the Council of the Royal Horticultural Society to be drawn from the London district, and, presumably, from the profession. If he really means that no amateur, no clergyman, and no countryman should ever be on the Council, he will do well to say so plainly, and if his opinion proves to be that of the majority, it will be time for the Fellows who are in all or any of these categories to resign. Other correspondents have lately been urging the wisdom of the amateurs being represented, and of the rural districts being brought within the Society's influence. There is not always help in a multiplicity of counsel, and it is difficult to see any practical help in the letter of the practical "Horticultural Fellow." *George H. Engleheart, Appleshaw, Andover.*

I had written a long letter, but "A Horticultural Fellow," dated January 20, has written so well, that my occupation is gone. Allow me, then, to hope that February 11 will result in a good matter, and a clear understanding be given why the Secretary should be allowed to assume a dictatorship. Another thing strikes me as an extraordinary expenditure; the Journal of the Royal Horticultural Society costs the Fellows, with postage, £750 6s. 5d., Mr. Barron's pension £180—virtually £1000—nearly one-third of the entire income on a blue-book which is never read, and which would be so much more useful if published by the horticultural press, and thus save £750 a-year. We require also to be told who was responsible for the Secret Committee? Some names appear on it which I was very sorry to see. Some years since, I remember, one of the said committee figured in a somewhat similar occupation, which resulted in the resignation of my friend Mr. Dodwell, of Carnation celebrity. The affair of Mr. Barron's seems a difficulty; the successor of Mr. Barron may be already born, but he is not made. *A Poor Fellow of the Royal Horticultural Society.*

**ORIENTAL LILIES.**—I was interested in the communication on the above in vol. xix., p. 75, by Mr. Williamson, especially in respect to *Lilium giganteum*, in which I note he deprecates the use of manure, especially in the liquid form. A good-sized bulb planted in 1833 in a Rose-border in this garden, with a north-east aspect, flowered for the first time last summer, the spike being a very strong one, and seventeen perfect flowers were developed, which have given me any amount of seed, of which I send you a podful. I notice in Nicholson's *Dictionary of Gardening* that he gives six to twelve as the average number of blooms. When I planted the bulbs of this species I put a small quantity of peat with them, and since that time it has benefited by the dressing of good rotten manure put on the Rose-border each year, and as soon as the spike reached 3 feet in height, I deluged the plant with farm-yard liquid-manure, and to this I attribute some part of my success with the Lily. Does Mr. Williamson mean that this liquid-manure injures rather than assists the development of the spike, or the bulb in after years? I have been given to understand that the bulb of this variety dies away after flowering. Is this so? At any rate, I am hoping to see some young bulblets appear this spring. *J. Mayne, Bickton, East Devon.*

**GROWING UNRIPE SEEDS.**—In your leading article on the effects of growing unripe seeds, I would like to remark that from my experience, gathered from the information of friends abroad, they all agree that this remark specially applies to economic plants. If the seed has been gathered from young trees, it is immature, and the trees never prove a success. To go to the extreme in this case, seed gathered from wild trees, such as the Coffee, which have been found growing in the forests, make fine trees, both strong and healthy, and yield large crops. Every year more importance is being attached to the collection of such seed by cultivators. Although I have lately had some slight success with the transportation of seed of *Erythroxylon coca*, I have great difficulty in raising plants from these seeds, in comparison with

the seed taken from old trees that are growing in my houses, showing that the seed does suffer by transport and age. I have just been informed by a friend who is connected with the surveying expedition in South-East Africa, that his men report that they have come across a large plantation of wild Coffee trees. The trees were laden with fruit, and the ground had quite a thickness of Coffee debris upon it under the trees. I have sent out to have some of this seed carefully collected and sent to England, as we have no idea what variety it can be. *Thos. Christy.*

**UNDERGROWTH IN GAME COVERT.**—At this place, Erlestoke Park, Wilts, the Periwinkle, *Vinca major*, grows well under trees, also Wood Laurel, *Daphne laureola*. The last-named has one fault, it loses its bottom. We have Tree Box from 3 feet to 10 feet high, and the same widths, and these the rabbits do not gnaw. I have also planted in the coverts old Box edging plants 2½ feet high. *Hypericum calycinum* is another plant of low growth which does not get touched by rabbits or hares. We have nothing else here as undergrowth in the woods. *J. Wood.*

**DENDROBIUM WARDIANUM.**—I was pleased to see the notes of a gardener who has been successful with this beautiful species of *Dendrobium*, and should be very grateful, as would doubtless be many others, if Mr. James Hebdien would kindly state the kind of treatment he pursues with this Orchid. *Anxious.*

**FARMERS AND FRUIT CULTURE.**—Practical men who have to get their living by fruit-growing will smile at "A. D.'s" advice, at p. 114, to plant fruit trees thickly, and in three or four years to lift and replant them. It will barely pay to plant the trees once, let alone the expense of lifting and removing six or seven-year-old trees to some distant piece of ground, and planting and staking them; nor will it pay for trenching the ground. A much more economical plan would be to plant the trees at the proper distance apart in the first instance, cultivate, and crop the ground with vegetables; for a soil that will grow good vegetables will produce good fruit. Should the orchard be formed from pasture land, Potatoes would be an excellent crop the first year; then anything afterwards that is likely to pay best. Trees growing rank, and needing root-pruning, a row of Celery planted 6 or 7 feet from the trees, would, when this comes to be earthed, serve the purpose of root-pruning, and another year the same may be done transversely. Some of the trees may bear fruit the following year, but if lifted bodily, no crop could be expected. I have served some old trees in this manner for some years, not with the view of root-pruning, but in order to place a supply of fresh food within reach of the roots. The row of Celery was, and is, planted on the surface, just clear of the drip of the branches; but to get sufficient soil for earthing, it had to be taken for a distance of 3 feet underneath the branches, and to a depth of about 18 inches, or down to the clay, some of this being used to bank up the more friable soil. The spaces between the rows are dug up the depth of the spade, and 6 inches of manure, with the lung litter as brought from the stables, is placed therein, to prevent the clay adhering to the man's shoes when taking up the Celery. Without it the bottom would be converted into a "pan," preventing the passage of water downwards, and so long as the strawy particles are not decomposed, the passage of water and air through the upper soil is facilitated. The rows of Celery were only planted on one side of the trees in the first instance, but since both sides have been treated in their turn every three or four years, receding a little from the stem each time to avoid cutting the tufts of fibrous roots that have been put forth where the roots were severed before. As the trees met in the row I could not run trenches transversely, but the surface under the branches is pricked out annually, and the best mulch available wheeled on, usually in frosty weather, and spread after the frost is well out of the ground. "A. D." will, perhaps, retort that my method entails much labour, but I did not put the clay there, and I would not advise anyone to plant fruit trees where this substance is so near the surface. I recently listened to a paper read by a technical instruction lecturer on "Orchard Trees," and he advised making holes a few feet in diameter where the clay was near the surface, taking a portion of it out, and replacing it with more suitable soil. Advice like this, and that of "A. D.," is calculated to deter any one embarking in fruit culture, if ever so much inclined. By all means select suitable soil for the

trees, and such as needs no preparation. Crop with vegetables at first, and if these are not remunerative, fill vacant spaces with bush fruit trees, which have frequently proved more remunerative than the crop overhead. With the present conditions of land tenure, it is useless urging the farmer to plant fruit trees. If it is to be done at all it must be done by the landlords, and matters are not very encouraging for them; for more than one instance has occurred where the landlord has formed orchards, and in a few years after the farmer has left or become bankrupt, and the cattle have been allowed the run of the orchard and destroyed the trees. I saw an orchard last spring attached to an untenanted farmhouse, where the trees had been barked all round by cattle as high as they could reach. The contents of the orchard did not appear to be of any great value, but it would, I dare say, be all the same had they been. There is a little to learn in the handling, packing, and grading fruit, but even a farmer would soon master those little matters. I have advocated the use of boxes in preference to hampers for conveying fruit to market in this district more than a dozen years ago, and a few who have had fruit worth taking care of have adopted the plan. The hampers or baskets in this part are made of Willow, and are infinitely worse than the baskets or sieves seen in Covent Garden, and it is not unusual to see some with five score of Apples in. They are so flexible that on every movement the Apples in contact with the Willows must be impressed by them, and being so inconvenient for handling, they get frequent jerks in loading and unloading. Except the large market growers, most of the market produce in this part is conveyed to market in the ordinary farm-cart, which is so opposed to the light spring vans seen in the London market. We have not, with one or two exceptions, any that confine themselves to fruit culture in this part; but it is associated with farming, vegetable culture, Willow culture, and basket-making, or some other industry or occupation, and the chief fault I have had to find with them is the handling of the fruit. *W. P. R., Preston.*

**EARLY BUDDING OF THE DOUBLE FLOWERED WHITE-THORN.**—Amongst the many indications of an early spring, perhaps none is more striking than a double-flowered White-thorn I noticed this morning in the grounds of Beckford Hall. This tree is growing in a shrubbery having a north aspect, and at the time of my visit, January 28, it was green all over, the leaf and flower-buds ready to burst. In other parts of the grounds, Snowdrops formed almost white sheets of blossoms. *G. Read, Evesham.*

## FORESTRY.

### DISTRIBUTION OF ROOTS.

MANY fallacious ideas exist regarding the roots, their uses, and formation, which are not, however, confined to any set of persons, but are shared by those who have worked with and amongst plants all their lives. Darwin's researches and observations did much to render the properties of roots and their mode of growth familiar to the general reader, but there are many persons still whose principles or inclinations refuse to place much trust in the great naturalist's teachings. There are many facts concerning roots which may be learnt without going to books for them, providing the observer works with patience and without preconceived erroneous notions. One of the most interesting subjects, and perhaps the most important from a practical point of view, is the distribution and range of roots in the soil. A great many persons know little about this matter, and it is likewise true that no one can positively say without investigation, where or in what direction the roots of a long-established tree extend. The more primitive theory was, and is still in some quarters, that the roots, or, at least, the more important part of them, are to be found directly beneath the trunk. When a pig or cow died on a farm, this theory found practical application, and the carcass, if not thought fit for food, was buried as close to the stem of the farmer's favourite Apple-tree as possible. If a good Apple year followed the interment, no further proof was needed as to the effect of this application of a highly-concentrated manure, although in all probability, the only real

benefit derived at the time was due to the limited root-pruning which accompanied the digging of the hole. Such ideas as these may be thought to be confined to the unenlightened backward parts of these islands, but this is seemingly not the case. An article which appeared last year in a well-known illustrated weekly, contained some startling revelations in root-lore, which might fairly compete with the views of the "oldest inhabitant" on tree growth. In it we are told that "every Girton girl knows that a well-conducted British Oak spreads its roots as far and wide through the soil beneath as it rears its boughs above towards the air of heaven." This statement, though capable of qualification, would pass fairly well in a crowd, but it is evidently too moderate for the writer, for he proceeds, "but what every Girton girl does not, perhaps, so confidently know is this, that on the whole, the tips of the roots and the tips of the branches correspond roughly in situation with one another," &c. It would be interesting to have the writer's definition of "roughly" here, for at first sight it would seem that the Girton girl is not quite alone in her presumed ignorance of this interesting correlation of growth. Gardeners and fruit growers have hitherto been preparing borders for the roots of their wall fruit on principles which, according to this statement, are certainly wrong. The drainer, whose pipes get choked with what he calls roots, can no longer blame the Elm or Ash tree thirty or forty yards distant. Further on we are told, although from motives of modesty we would prefer not to repeat it, that "foresters and nurserymen know well you must lop the roots and the branches (when transplanting trees), so as to cover equal superficial areas, or else the water will not fall on the parts best adapted to receive it." The possession of this information by the followers of those callings must be exceedingly valuable to them, and nurserymen at least have clearly a scientific answer to give grumbling customers who complain of bad-rooted trees. It is rather curious, however, that the former should invent less plausible excuses for this frequently-recurring condition, but perhaps it has hitherto been a trade secret, and only imparted to foresters as a special favour. We have yet to learn how that intimate connection (or we ought more properly to call it, a correspondence) is maintained between the tips of the roots and the tips of the branches, which enables the one to know the (roughly speaking, of course) exact position of the other, so as to prevent the over-reaching of the branches by the roots while the former are enjoying their winter's nap. A. C. F.

## LAW NOTES.

### ACCOUNT FOR DAFFODIL BULBS.

**JOHNSON v. PIPER.**—In this case, Messrs. Johnson & Son, seed merchants and florists, of Long Sutton, sued Messrs. T. Piper & Son, seed merchants and florists, of Maresfield, for £8 15s. for goods sold. Mr. J. Holt appeared for the plaintiffs, and Mr. G. E. Hillman for the defendants. Mr. J. Johnson, a member of the plaintiff's firm, deposed to receiving and carrying out, in May, 1894, an order for 50,000 Daffodil bulbs, at 3s. 6d. per thousand. After the bulbs were got ready, they received a letter asking them not to send them until they wrote again. They were, however, sent, and a letter received acknowledging them, and promising to pay in three months. In cross-examination, witness admitted that the bulbs were taken up a month earlier than usual. They were, however, ordered from sample. They had had no letter from defendants stating that the bulbs were heated and rotting, and that they would plant them, and pay for such as turned out good. John William Cross, in the employ of the plaintiffs, deposed that the bulbs were sent off in a dry and perfect state. For the defendants, Mr. Piper, jun., said the bulbs when unpacked were in bad condition, owing to having been lifted too early. They laid them in a trench, and wrote to plaintiffs that they should claim a reduction for such bulbs as proved bad. He considered the good bulbs worth

about £1 or £1 10s. George Goldsmith, in the employ of the defendants, described the bulbs as in bad condition, and for the most part unfit for sale. Mr. Kenward, nurseryman and florist, deposed that bulbs taken up in May, and packed in sacks for transit, would probably heat and spoil. Judgment was given for the plaintiffs with costs.

## SOCIETY.

### ROYAL HORTICULTURAL.

#### Scientific Committee.

JANUARY 14.—*Present:* Dr. M. T. Masters in the chair; Dr. Müller, Rev. W. Wilks, Mr. Douglas, Mr. Michael, Dr. Russell, and Rev. G. Henslow, Hon. Sec.

*The Colouring of Flowers and Fruit.*—The following communication was received from Mr. Roppell, of Harvey Lodge, Roupell Park, in reply to inquiries upon the artificial colouring of Apples:—"The lime used was the best chalk lime air-slaked. The lime and soot formed part of the compost with which they were planted; say, one part soot, two parts lime, and twenty parts ordinary kitchen-garden soil, carefully blended. In this comparatively dry and warm compost the trees made short growths of well-ripened wood, and bore well the second year. I have since had lime and soot sown over the trees just before the buds began to burst in the proportion of two parts lime and one part of soot, and at the rate of half a pound of the mixture to the square yard. This served as a protection against the larvae of certain moths, as well as a manure. The soot and lime should be used quickly to avoid the escape of ammonia. The mixture caused a deeper colour in Apples and Pears. This was especially so in Lane's Prince Albert, Red Juneating, Mr. Gladstone, Irish Peach, Melon Apple, Cox's Grange Pippin, Beauty of Kent, and Peasgood's Nonsuch. The pale green varieties, such as Lord Suffield, were, I think, made to assume a deeper green, just as grass and Wheat do when dressed with a similar mixture. My experience is that Pears and Apples are more highly coloured when grown on a soil abounding in iron and dressed with lime and soot than in a soil deficient in iron and lime. Louise Bonne of Jersey, Beurré Clairgeau, Tront Pear, Clapp's Favourite, Buroudeau, Beurré Rance, Uvedale's St. Germain, Verulam, Vicar of Winkfield, and Catillac, are deficient in colour when grown on a cold clay soil. I have also observed that Apples and Pears are more brightly coloured in a good showery season than in a very dry and hot one, and that some Apples, such as the Dartmouth Crab and some astringent cider Apples are red all over and not merely on the sunny side." With reference to other fruits, Mr. Roppell further remarks: "Black Grapes colour best in partial shade, and white varieties when exposed to the sun. They then assume an amber tint. Thomson's Vine-manure intensifies the purple or black of Grapes. Green Tomatoes become red when ripened in the dark, and some Apples gathered green become deep yellow, and flushed with crimson, according to the variety in the fruit-room." The secretary observed that several letters had appeared in the *Gardeners' Chronicle* upon this subject, some writers attributing the brightening of the colour mainly to "air and direct sunlight," others to the presence of iron, sulphate of iron and soot being given. "The iron helps the colouring by its absorbing sun-heat, and thus rendering the soil warmer." One writer observed that, of 100 trees of Wellington Pippin, only one gave red Apples, and "that tree had soot and iron given to it. With these, and plenty of light and sun, I got the best colours I can wish for." The writers generally insist on a warm soil. In commenting on these experiences, Dr. Müller observed that it was theoretically doubtful whether the iron—a common ingredient in all soils—has any effect, as it enters only to a very minute extent into the essential parts of plants (the chlorophyll). If it be applied with lime, then the solution of iron sulphate, under the influence of the air, is very soon changed into calcium sulphate and ferric hydrate. The former may then act beneficially as a "holder" of ammonia, and enhance the activity of the soil. But since the soot contains ammonia salts (chiefly sulphate), it would seem that the colouring may be most probably traced to this ingredient, rather than the iron or lime. It was suggested that experiments should be tried by using nitrate of ammonia, in the proportion of 1 oz. to a gallon of water.

*Rose Sportings.*—Mr. J. Hall, of Cheltenham, wrote to say that "in the summer of 1890, a Rose grown on Dartmoor from a slip of a tree in Torquay, bloomed, and on comparing the two the one from Dartmoor was a deep red-orange, the one in Torquay, a pale lemon-yellow. The soil in Torquay is the red sandstone; Dartmoor is decomposed granite with some peat." Mr. Wilks observed that the Rose (from the above description), might be William Allen Richardson, which is of a deep apricot colour, but has the habit of sporting to a pale yellow, so that the soil may not have been the cause.

*Cyclamens Unhealthy.*—Mr. Leek, of Bullington House, forwarded a plant which did not appear to be attacked with any disease, but had received some check by cold draught, or other cause. Mr. Douglas observed that he had experienced a similar effect in some of his plants. Mr. Leek also sent a Primula, remarkable for an increased viscosity, but it appeared to be perfectly healthy.

*Lycaste Skinneri, virescent.*—Dr. Masters showed a drawing of a specimen received from Mr. Snader, in which the perianth was green. The cause of virescence is obscure, being permanent in the well-known green Rose.

*Dianthus Attacked by Grubs.*—With reference to this subject, brought before the committee at the last meeting, Mr. Douglas remarked that he had lost some thousands of plants, and that the only remedy was to pick out the grubs with a needle. Dr. Müller observed that it attacks the very youngest plants when only three or four leaves are present, and especially *Dianthus glacialis*.

*Peach Tree Gumming.*—Mr. S. T. Wright sent a piece of a trunk badly gummed from Chiswick, saying that it appeared to have some grubs upon it, but none could be seen. It was forwarded to Mr. McLachlan for further investigation. Mr. Douglas observed that when gumming first appears, trenching all round the roots, with the insertion of fresh loam, checks it at once; but if it has reached an advanced stage, as in the specimen sent, the tree must be removed.

*Pinus Coulteri (macrocarpa).*—Dr. Masters exhibited some handsome cones and foliage of this tree, grown at Lord Ducle's grounds, Tortworth, Gloucestershire. It is also quite hardy in Kent. He observed that it was harder than *P. insignis*, though it comes from a lower altitude than the former in California. There is a variety sometimes met with in which the scales are blunt at the end.

*Orchids, Monstrous.*—Baron Sir Ferd. Von Müller sent specimens, drawings of which were shown by Dr. Masters, of flowers of *Glossodia* and *Calceana*, the former having three lips, while the latter had no lip but a petaloid column, &c.

## FRUIT REGISTER.

### APPLE, DUTCH MIGNONNE.

This is one of the best late Apples for kitchen use, and is one not to be despised for dessert purposes during the months of February and March. It is one of the yellow-fleshed kinds, to which class most of the best-flavoured Apples belong; and although classed in most fruit catalogues as a kitchen variety only, I find it very useful as a late dessert kind, choosing for that purpose the medium-sized and best coloured fruits. This season the flavour seems unusually good, and in my opinion decidedly better than King of the Pippins, Fearn's Pippin, and some others that are always classed as good dessert varieties. Its cropping qualities are excellent; if any fault, it is that it bears too heavily, and if not thinned, many of the fruits are small. Our trees, which are orchard standards, planted about twenty-five years ago, have not failed to produce a good average crop for many years past. Fruits of this variety should be among the latest gathered, and be left on the trees as late in October as the state of the weather permits. C. H.

## MARKETS.

### COVENT GARDEN, JANUARY 30.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. ED.]

#### PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

	s. d. s. d.	s. d. s. d.	
Adiantum, per doz.	4 0-12 0	Foliage plants, doz.	12 0-24 0
Aspidistra, per doz.	12 0-30 0	Hyacinths, per doz.	9 0-12 0
— specimen, each	5 0-15 0	Lilium Harrisii, per	dozen pots
Azalea, per plant	2 0-3 6	Marguerites, p. doz.	6 0-12 0
Chrysanthemums,		Mignonette, p. doz.	6 0-9 0
doz. pots	6 0-12 0	Palms, various, ea.	2 0-10 0
Cyclamens, per doz.	9 0-15 0	— specimens, ea.	10 6-84 0
Dracaena, each	1 0-7 6	Poinsettia, per doz.	12 0-18 0
— various, p. doz.	12 0-24 0	Primula sinensis,	
Ericas, various, doz.	9 0-24 0	per dozen	4 0-6 0
Evergreen Shrubs,		Tulips, doz. pots	6 0-8 0

OLD POTATOS.

There is no movement in this trade, and prospects are certainly not favourable for better prices. A cold February would have a tendency to lift us out of a possible bad finish.

NEW POTATOS.

Larger quantities are coming to hand, and consequently prices have been put much lower, viz., from 16s. to 18s.; fancy samples, 20s. to 24s. per cwt.; and small, 14s. do. J. B. Thomas.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following—  
0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W. 9, Ireland, N.; 10, Ireland, S. \* Channel Islands.

ADDRESS: H. & F. The address of Mr. D. M. Davies is 11, King Street, Brynmawr.

A GOOD CROP OF CUCUMBERS: *Market Grower*. As many as a plant can develop to a fair size without being seriously checked in growth. We can only say what is the approximate number a plant can carry from first to last, much depending on the vigour of the plant, whether the fruits were left till fully grown, and the number left on the bine at any one time, on culture, &c. A strong plant should be able to perfect twelve fruits fully in one month, besides carrying as many small ones to succeed these.

BLACK CURRANTS: *W. H. S.* The bushes are infested by the Currant-bud mite, and you must cut off and burn all shoots having unduly swollen buds. In this instance, as in many others, the somewhat abused tomtits do good service in devouring the mites.

BOOKS: *Ambitious*. A cheap book is Kemp's *How to Lay Out a Garden*, published by Bradbury, Agnew & Co., Limited, 10, Bonverie Street, E.C. 2. *Botany for Beginners*, published by Bradbury, Agnew & Co., Bonverie Street, Fleet Street, E.C., if you can get it, but it is probably out of print; *Structural Botany*, by D. H. Scott, published by Adam & Chas. Black, London, in 1894.—G. A. Wolf's *Analysis of Plants*. Enquire of Messrs. Williams & Norgate, 14, Henrietta Street, Covent Garden.

CHARCOAL FROM A FILTER: *X.* It is probable that you will note the good effects of the use of this substance in potting soils. Ordinary charcoal has a merely mechanical effect on the soil, rendering it, when mixed with the soil in a finely comminuted state, porous, at the same time that it absorbs water to a large extent, thus affording available moisture to the roots of plants. We are not surprised to hear that Pelargonium cuttings root freely in it. They do this in powdered brick equally freely.

EARLY MARKET TULIPS: *Pomologist*. These are obtained early in flower by purchasing naturally early-flowering varieties as soon as they can be obtained from the importers. The bulbs are placed in boxes of light soil or cocoa-nut fibre refuse, and kept in the dark in a cool place till a good number of roots are made, when forcing commences. It is usual to force them in the boxes in which they have made root, transferring them to baskets, pots, jardinières, or selling them as they stand when on the point of opening their blossoms. Those early-bloomed Tulips, which come on about the end of December, have a very short scape, and they are not "drawn," as you suggest.

EXAMINATION IN HORTICULTURE: *Ambitious*. You should make enquiries of the secretary, 117, Victoria Street, Westminster, S.W.

GARDENERS' DIRECTORIES: *A. S. P.* These books are to be obtained at the offices of *The Garden*, 37, Southampton Street, Strand, W.C.; and *Journal of Horticulture*, 171, Fleet Street, E.C.

GRUBS: *T. V.* Those sent are the grubs of the Maybug, *Melolontha vulgaris*. They remain as grub and chrysalis about three years underground. We do not think you can do better than turn up the soil with a digging-fork occasionally, thus exposing the grubs to the attention of the birds. There is nothing you could use against them that would not injure the plants.

KNIFE FOR CUTTING MUSTARD AND CRESS: *Cress*. Such a knife as that you describe can be bought of Messrs. Blackburn & Horner, gardeners' sundriesmen, 43, Wellington Street, Covent Garden, W.C.

MARKET FLOWERS: *H. H. A.* We should advise you to visit the markets at all seasons, noting what they are supplied with. We may mention Carnations, Orchide, tender Annuals, as Aster, Stock, Sweet Sultan, Zinnia; Roses, a few varieties of pretty form and decided colours, or pure white; *Stephanotis floribunda*, *Chrysanthemums*, all kinds of forced plants, bulbs, &c., white Lilac, *Petnias*, single, double-flowered, decorative, Ivy-leaved, and other species and varieties of *Pelargoniums*, &c.

NAMES OF FRUITS: *B. W. W.* 1, Blenheim Orange; 2, much bruised, not certain; 3, New Hawthornden.—*W. Fisher*. Large, Small's Admirable; small, Golden Winter Pearmain.—*P. R.* 1, unknown; 2, Winter Quoining; 3, unknown; 4, Cellini; 5, Pear Vicar of Winkfield.—*Shirburn*, Rosemary Russet.

NAMES OF PLANTS: *W. C. Rossiter*. Specimen has no flowers, but it is probably *Hypericum humifusum*.—*F. H., Darmstadt*. So far as we can judge by the dried flower sent, your *Lælia* is *L. albida*. Hybrids of it have appeared, but they bear larger flowers than yours, and the labellum is different in shape, and the column stouter.—*F. P.* 1, *Epidendrum ciliare*; 2, *Epidendrum cochleatum*.—*Thos. P.* *Lælia anceps*.—*J. F.* Your *Rhododendron* is *R. canescens* var. *Nobleanum*. As you observe, it is a pity that these early-flowering *Rhododendrons* are not more grown in gardens.

NITRATE OF SODA: *Gardener*. You may apply it to the turf of the paddock when the grass begins to grow freely at the rate of 5½ cwt. for the whole season, in two dressings at an interval of a month, of 1 oz. per superficial yard. Apply it, if possible, in rainy weather.

OCTOBER-REMOVED PEACH TREES: *Pomologist*. The trees would carry half to two-thirds of an ordinary crop this year. You would do well to be guided in this matter by the nature of the wood-growth made; if it be weak and late in pushing, crop lightly—say, half a crop.

PALM FOLIAGE DRIED UP: *T. H. B.* You should know better than we what has caused the injury. It is probably the result of excessive dryness of the soil in which the plants were growing, or of exposure to gas containing much sulphur, or to frost.

PHOTOGRAPHING PLANTS: *Pomologist*. We believe Mr. Upcott Gill, *The Bazaar* office, 170, Strand, publishes a manual on this subject, which will afford you the kind of information that you are seeking. There are many little requisites besides the camera, but the cost of these is not great. Why not consult the editor of the *Photographic Art Journal*, Charterhouse Square, E.C.

PRIMULAS FAILING TO OPEN THEIR FLOWERS PROPERLY: *G. T. M.* The result of some kind of check, such as dryness at the root, cold, &c.

SEEDLING PEACHES: *G. W. E.* You will be able to test the fruits in a shorter period of time if you bud them on to the Plum stock, or a shoot of a bearing Peach or Plum tree. On their own roots they might not fruit under five or six years.

TO KEEP A CONSERVATORY GAY THE YEAR ROUND: *W. B. S. N.* To be able to do this satisfactorily, you must be a good gardener, understanding the culture of a great many species and varieties of plants; and we do not suppose that any manual would serve your purpose, or take the place of actual practice in a garden.

WILLOW FOR GROWING INTO TIMBER: *G. W. E.* *Salix alba*—the common indigenous species.

DIED.—On January 23, at Blairhill, Rumbling Bridge, N.B., JAMES RICHARD HAIN, of Blairhill, and Highfields Park, Sussex, aged 61. Friends will please accept this intimation.

CONTINUED INCREASE IN THE CIRCULATION OF THE "GARDENERS' CHRONICLE."

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper, increased to the extent of more than 80 per cent., and that it continues to increase weekly.

Advertiser are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

**A SEEDSMAN'S CLERK** seeks re-engagement. Good character. Thoroughly respectable and trustworthy.—TRUST, *Gardeners' Chronicle* Office, 41, Wellington St., Strand, W.C.

**STARTLING NEWS** is daily coming to hand of sad accidents, murders and minor criminal offences, but it is astonishing that thousands of people die in our midst every week, and no notice is taken of the fact. Yet such a terrible calamity could be prevented if more stringent attention was paid to the laws of health. If people would only deal seriously with slight ailments they would not develop into fatal diseases. There are thousands of persons killed yearly simply through neglect. **HOLLOWAY'S PILLS and OINTMENT** can prevent as well as cure disease, and if they were used according to directions, there would soon be a decrease in the death-rate. They can be obtained from all chemists and medicine vendors.

**CHRYSANTHEMUMS.**

We have great pleasure in announcing that we have received from H. Briscoe-Ironside, Esq., a stock of his grand new Japanese—

**MRS. BRISCOE-IRONSIDE.**

The name will show the raiser's opinion of this variety, which he considers the best thing he has ever produced; it has been awarded First-class Certificates every time exhibited (unanimous votes each time), and is, without doubt, the most beautiful Jap. yet seen. The colour is most lovely, a delicate transparent flesh tint, and the bloom large without a trace of coarseness. Every grower, whether for exhibition or personal pleasure, should secure at once. Plants, 6s. each.

## VEGETABLE AND FLOWER SEEDS

FROM THEIR OWN

### APPROVED STOCKS.

*J. V. & SONS' SELECTION for EXHIBITION PURPOSES includes :—*

- |   |  |
|---|--|
| <p><b>PEA, VEITCH'S CRITERION.</b>—Abundant cropper, large pods, and delicious flavour. Per quart, 2/-.</p> <p><b>BEAN, VEITCH'S IMPROVED LONGPOD.</b>—The Earliest and Finest of the Longpod section. Per quart, 2/-.</p> <p><b>BRUSSELS, VEITCH'S EXHIBITION.</b>—Remarkably fine and distinct. Per packet, 1/6.</p> <p><b>CARROT, VEITCH'S MODEL.</b>—The best for shape, quality, colour, and table use. Per ounce, 1/-.</p> <p><b>CAULIFLOWER, VEITCH'S AUTUMN GIANT (Selected).</b>—The grandest Cauliflower in cultivation. Per ounce, 2/-.</p> <p><b>CUCUMBER, VEITCH'S "PERFECTION."</b>—Growing from 18 to 20 inches long. Per packet, 2/6.</p> | <p><b>LEEK, VEITCH'S SELECTED LYON.</b>—The largest in cultivation. Per packet, 1/6.</p> <p><b>LETTUCE, VEITCH'S SUPERB WHITE COS.</b>—Grows to an immense size; fine flavoured. Per packet, 1/6.</p> <p><b>ONION, VEITCH'S MAINCROP.</b>—Large size and heavy weight; good keeper. Per ounce, 1/6.</p> <p><b>PARSNIP, VEITCH'S IMPROVED HOLLOW CROWN.</b>—Large heavy cropping variety. Per ounce, -/6.</p> <p><b>TOMATO, FROGMORE SELECTED (NEW).</b>—Almost round, very firm and solid, bright red, and great depth of flesh. Per packet, 1/6 and 2/6.</p> <p><b>TURNIP, VEITCH'S RED GLOBE.</b>—Remains a long time fit for use. Per ounce, -/6.</p> |

*J. V. & SONS' SELECTED STRAINS of CHOICE FLOWER SEEDS embrace :—*

### VEITCH'S SUPERB PRIMULAS.

Chelsea Blue, Rose, Scarlet, and White.  
Per packet, 3s. 6d.

VEITCH'S SPECIAL MIXTURE of the above, per packet, 3s. 6d. and 5s.

### G. F. WILSON'S BLUE PRIMROSES (NEW).

Flowers freely produced in many shades of blue, from pale lavender to deep violet.  
Per packet . . . . 2s. 6d.

### VEITCH'S SUPERB GINERARIAS.

Crimson, Blue, Purple, Red, White, Magenta, Blue-edged, Crimson-edged, and White-edged.  
Each, per packet . . . . 1s. 6d.

VEITCH'S SPECIAL MIXTURE, Per packet, 1s. 6d. and 2s. 6d.

**PANSY, or HEARTSEASE.**  
VEITCH'S SUPERB STRAIN,  
Per packet, 2s. 6d.

**MIGNONETTE, GOLDEN MACHET**  
(New), per packet, 1s.

### STREPTOCARPUS, VEITCH'S IMPROVED STRAIN.

Saved from the newest and brightest coloura, and embracing all the finest varieties . . . . per packet, 2s. 6d.

Red and Rose Shades . . . . .	per packet	2s. 6d.	White, Self, Striped, and Blotched Varieties . . . . .	per packet	2s.
Purple and Violet Shades . . . . .	"	2s. 6d.	Ordinary Quality (with cultural directions) . . . . .	"	1s. 0d.

The Horticultural Press for 1895 has unanimously expressed its opinion of the great advance in both richness of colour and in the size and form of flower of the many new and magnificent varieties.

*DESCRIPTIVE CATALOGUE, with full Cultural Directions, post-free.*

# JAMES VEITCH & SONS,

ROYAL EXOTIC NURSERY AND SEED ESTABLISHMENT,  
KING'S ROAD, CHELSEA, LONDON, S.W.

THE BEST  
NEW PEAS.

WEBBS'

'ENTERPRISE.'

A new and valuable variety, growing to the convenient height of from 2½ to 3 feet. Its dark green pods are produced abundantly, and contain from 8 to 9 large peas of the finest quality when cooked.

From Mr. H. FOXHALL, Gardener to H. S. Williams, Esq., The Lodge:—"Webbs' Enterprise Pea is the best in both flavour and quality that I ever grew, and one I should highly recommend."

3s. per pint, post-free.

WEBBS' 'TALISMAN.'

A blue wrinkled pea, which has been raised from a cross between the varieties Culverwell's Giant Marrow and Omega. The pods are long, straight, very handsome in appearance.

From Mr. C. J. WAITE, Gardener to the Hon. W. B. Talbot, Gleohurst:—"Webbs' New Pea, Talisman, is the finest variety in this garden."

3s. 6d. per quart, post-free.

See Webbs' Spring Catalogue, post-free, 1s.

WEBBS', WORDSLEY, STOURBRIDGE.

BEGONIAS—A SPECIALTY.

Awarded Nine Gold Medals and Gold Cups.

Seed saved from prize plants. Choicest mixed, single or double varieties, 1s., 2s. 6d., and 5s. per packet; Collections (seed), single, 12 named varieties, separate, 5s. 6d.; 6 ditto, 3s. Tubers, named singles, from 18s. to 60s. per doz.; choicest seedlings, 3s. to 20s. per doz.; bedding, choicest, 4s. to 9s. per doz.; choicest named doubles, from 18s. per doz.; choicest seedlings, 6s. to 30s. per doz.; choicest mixed, for bedding, 9s. to 16s. per doz. CATALOGUE gratis.

JOHN LAING & SONS, <sup>Begonia</sup> Growers, &c.  
FOREST HILL, LONDON, S.E.

Williams'  
NEW

GIANT PRIMULAS.

PRIMULA SINENSIS FIMBRIATA  
"Magnum Bonum," Red (Sterling Novelty for 1896).

We have every confidence in placing this Novelty before our Customers, feeling confident that it will become very popular. The plants are very sturdy and compact in habit; the flower stem is strong, and rises well above the strong, robust foliage. The blooms are produced in great profusion, are of a gigantic size, beautifully fringed, and the colour is a very beautiful shade of a rich deep red. Per packet, 5s.

PRIMULA SINENSIS FIMBRIATA  
"Snowball," White.

Is, without exception, the finest White Primula in cultivation, and we feel confident that it cannot fail to give satisfaction wherever it may be grown. It is more vigorous in growth than the old varieties, the foliage being remarkably strong. The flower-stem is very sturdy, rises well above the foliage, and bears a profusion of massive flowers of a pure white colour of great substance. The individual blooms measure 2½ inches in diameter, and are exquisitely fringed. Per packet, 5s.

From the Rev. H. C. LITTLEWOOD, Hurston Rectory:—"The Primula Seed I had of you last spring has produced some splendid flowers."

Illustrated Seed Catalogue for 1896 is now ready, and will be forwarded gratis and post-free to all applicants.

B. S. WILLIAMS & SON,  
Seedmen and Nurserymen to Her Majesty the Queen,  
Victoria & Paradise Nurseries, UPPER HOLLOWAY,  
LONDON, N.

SANDER'S  
GREAT SPRING SALE.

FOR AMATEURS and THE TRADE.

13,000 ORCHIDS  
WITHOUT RESERVE.

THE BEST HARDY PLANT OF THE CENTURY,  
500 CLUMPS of  
HEMEROCALLIS AURANTIACA MAJOR.

THE MOST MAGNIFICENT  
BURMESE DENDROBES,  
D. AURRUM, WARDIANUM, NOBILE, FINDLAYANUM,  
BENSONLE, FYTCHEANUM, all the finest kinds. All un-  
flowered in Europe. Immense variety, and splendid plants, in  
large and small Lots, to suit all Buyers.

THE BURMESE  
CYP. INSIGNE & C. CHARLESWORTHII,  
Both from New District, and found growing together.  
NEW Yellow and Black-Spotted Bouquet-Flowered ONCID.

A NEW PHAIUS?—Titanic old flower stems.  
ONCIDUM No. 2.—Probably the magnificent  
O. LILIFLORUM. The only plant in cultivation is in  
the DELL COLLECTION.

NEW CYMBIDIUM from BURMA  
Spikes and Growths appear identical with C. Traceyaum.  
Cypripedium Charlesworthii, found growing with  
C. insigne.

300 ORCHIDS IN FLOWER AND BUD.  
11 CATTLEYAS, magnificent kinds, described by Collector,  
and guaranteed. And other MAGNIFICENT ORCHIDS.  
TO BE SOLD ON

At the CENTRAL AUCTION ROOMS,  
67 & 68, CHEAPSIDE, LONDON, E.C., by  
Messrs. PROTHEROE & MORRIS.

JAMES VEITCH & SONS

Have much pleasure in introducing  
amongst their Novelties for the  
Season, a superb

NEW TOMATO

"ALL THE YEAR ROUND."

First class Certificate, Royal Horticultural Society,  
April 23, 1895.

A very superior variety raised by Mr. Farr, gardener to  
A. Pears, Esq., Spring Grove House, Isleworth. The fruit  
is rather below the average size, bright red, and of a Plum  
shape, very solid, and of high quality. It is abundantly  
prolific, producing clusters at every joint. Ripe fruit can  
be obtained all through the year by making two sowings,  
one in February, and again in August. The plant is of  
good constitution, with strong vigorous growth, and is  
remarkable for its continuous bearing, both under glass  
and in the open ground.

Per Packet, 2s. 6d.

A CATALOGUE of all other NOVELTIES  
and SPECIALTIES

Post Free on application to—

THE  
Gardeners' Chronicle.

SATURDAY, FEBRUARY 8, 1896.

A SCOTT.

(See Illustration, p. 173.)

ASCOTT, the residence of Leopold de Rothschild, Esq., is almost instinctively associated in the minds of gardeners with the growth of the Malmaison and other Carnations, which have been so successfully cultivated there for many years past. It is not by any means, however, in this one particular branch of gardening only that Ascott deserves notice, for every department of the garden is most efficiently maintained, both from the point of pleasure and productiveness. Carnations at the time of my visit were not flowering, but finer or more promising plants could not be desired. Malmaisons in variety are grown in thousands, and the older plants of these represented a picture of health, whilst the younger stock from last year's layers by their sturdy appearance give every promise. Mrs. Leopold de Rothschild Carnation, a variety that has now fully established its character as one of the very best pot kinds, was just coming into bloom. It is more tree-like in growth than Miss Joliffe (which is undoubtedly one of its parents), with a deeper tint of colour in its fragrant blossoms. A number of other approved kinds are grown, and Mr. Jennings is always alert for any fresh kind of merit. One span-roof house was entirely occupied with two kinds of Begonias; Gloire de Sceaux and Gloire de Lorraine; the former kind is now in very vigorous growth, and has foliage of unusual substance. With the deep metallic lustre suffusing the leaves, the bright coral pink of the blossoms form a most pleasing combination, more particularly as these colours are seen under artificial light, hence it makes a choice vase plant. Gloire de Lorraine is quite distinct from the preceding in every respect, having small bright green foliage, with a dwarf habit and small trusses of bright rose-coloured flowers, which are produced in such profusion as to militate against the proper growth of the plants if they are not constantly picked off until the plants are well established. Zonal Pelargoniums are largely grown for winter flowering, one house being filled with dwarf sturdy plants of the best kinds, "Raspail Improved" being one of the favourites. Poinsettias occupy another house, the stock of this invaluable winter plant being dwarf and hardy-looking. Cyclamen persicum are also noticed in quantity; and another house is well filled with Eucharis, and others with mixed decorative plants, in one of which there is a fine stock of Maidenhair Fern.

Roses under glass are largely grown, chiefly on the roofs of two span-roof houses, whilst a long corridor-like structure has recently been planted a-fresh with this popular flower, of which pot-plants are also grown in large numbers, many as standards.

Upon directing one's attention to the pleasure grounds, it is a difficult point to decide which part to admire most, so endless and diversified

are the features in these charming grounds. The chief object in the formation of any garden, be it large or small, should be the presentation of fresh and diversified attractions at every turn, these being so blended as to form one harmonious whole, yet each being complete in itself. This is the great feature at Ascott, for fresh surprises await one constantly, whilst there is not the slightest attempt at repetition, or of balancing one part with another. We need less of the formal and stiff style of gardening so prevalent in the earlier part of this century. The entire design of the Ascott gardens is unique in its way, reflecting the best possible evidence of the good taste of its owner, who acted himself as landscape gardener.

The mansion is so situated as to command extensive views of the surrounding vale and the hills in the distance. Towards the east the Bedfordshire hills are seen to advantage, whilst to the south is obtained a fine view of the Chilterns; then, again, away to the west there is a longer distance view in the direction of Aylesbury. The square towers of Mentmore are plainly visible also. The configuration of the ground is such as to place Mentmore on the spur of one hill, with an incline towards the south-west, whilst Ascott occupies a somewhat similar position upon another. The walls of the mansion (as, in fact, are those of nearly all the buildings around) are well covered with climbers, both evergreen and deciduous, the windows alone in many parts being visible by reason of the luxuriant growth. Amongst other choice climbers, the rare *Wistaria multijuga* is a fine feature, with its racemes of great length; the best of the *Ceanothus* genus are also represented. Shrubs clipped to various forms meet one frequently, but chiefly near the house, or within view of it. This style of gardening is in accord with the Elizabethan style of architecture adopted. During the summer months, many of the flower-beds are filled with tuberous Begonias; these are followed by spring-blooming plants. Borders, both narrow and broad, are filled with plants of a mixed character, chiefly hardy, amongst which Roses are noticeable in large quantities. The newest addition to the garden is a fountain of rare and singular beauty (fig. 24), representing a fairy water scene. It is well placed, with appropriate surroundings.

Another recent addition also is an alpine garden with a rockery, designed with taste, and planted with the best suited alpine plants and bulbs. Pools of water and aquatic plants are features of interest in other parts, so also is the dripping-well. One characteristic of these gardens is the hedges and specimens of the Golden Yew and other plants of similar character, as *Thuia Vervaeiana* and the Golden Queen Holly; all of these add to the picturesque effect of the garden, and make it bright at all seasons of the year. Rhododendrons, of which several clumps have been planted, are already growing into large masses. A sunken walk of considerable length affords, by reason of a wall on the one side, another opportunity of planting climbers, and this has been taken full advantage of.

Another garden, and that a most important one, is devoted to the most useful hardy plants and bulbs for cutting purposes during a long season, and each in its turn. Violets are grown here in great luxuriance. Climbers in this garden are grown upon wire arches and supports; climbing Roses, chiefly the Tea-scented and Turner's Crimson Rambler, are here very prominent.

For years past it has been the custom to

import large trees such as Horse-Chestnuts and others, both evergreen and deciduous. The earlier planted of these are now greatly adding to the effect, most of the surrounding ground having been formerly destitute of good arboricultural specimens. Some very healthy specimens of *Abies pinsapo*, are a noteworthy instance of this towards one of the lodges. The stables stand upon ground which, a few years ago, was under tillage. Now they are quite surrounded with trees and shrubs. The kitchen and fruit gardens are well kept; the utmost cleanliness prevailing, winter crops in the former look well. There has been an admirable fruit-store added recently, and there is no difficulty to well stock it.

For the recreation of those employed on the estate, as well as for others, a well-prepared cricket-ground has been laid down. During the winter evenings, classes are held for carving in wood, &c., thus affording occupation for all who in any way desire or seek self-improvement. The bothy is a model of what such erections should be, being well appointed inside, and having a picturesque exterior also.

In conclusion, the practical and painstaking work of Mr. Jennings, who for so many years has had charge of the garden, needs remark. Nor should another most pleasing fact be overlooked, viz., the provision for each of Mr. Leopold de Rothschild's sons of a separate span-roof greenhouse, the plants in which are carefully attended personally by them during residence at Ascott.

H. G.

## FRUIT SUPPLY OF COVENT GARDEN MARKET.

HORTICULTURISTS, and the public in general, are under great obligations to Mr. George Monro for his most informing and exhaustive treatment of this subject at the Crystal Palace, the Horticultural Club, and in your columns lately (p. 116). His lucid exposition of facts, difficulties, and remedies left little more to be said or desired. His latest statistics in your columns, showing a clear saving of 5*d.* per bushel on non-returnable boxes, should settle once for all the greatest source of worry and delay in the transmission of fruit and flower produce by rail or road. No one can write with greater authority on these and kindred subjects, as no living man passes more fruit through his business than Mr. George Monro. His protest against empties and bushel-baskets are therefore the natural outcome of his experience; and it corresponds with that of most growers who have had constant experience in the transport of garden-stuff by road, rail, river, or sea. With exceptionally careful packing the consignments have reached their destination in a fairly presentable state. But the empties, waited for through weary days, or even weeks, have often arrived at last as unrecognisable bundles of Willows and splinters, only fit for firewood. I confess that nothing in my practical experience of forty or more years has proved such a fertile source of trouble and trial as "returned empties"—a very large percentage of them never returned, and fully a fourth part returned smashed beyond using, but charged for all the same. Mr. George Monro and the Great Eastern Railway Company have earned the gratitude of home-growers in garden and field for their efforts, which must speedily prove successful, to command more safety and speed of conveyance at less cost, through the abolition of returned empties.

For supplying the public as the Great Eastern has already done with boxes at a cheap rate, it has conferred a boon on growers of garden produce and farm stuff. When largely extended, however, the railways will share the benefit with the public, and may, in fact, prove the predominant partners in the distribution of the profit. For once the abolition of empties for small consignments becomes general, each packet will be handed once by our carriers instead of twice as many times as now.

As I was lecturing at High Barnet lately, in connection with the University Extension Scheme, I obtained and exhibited a nest of the Great Eastern boxes, with a list of prices and charges for conveyance. These excited much interest and I enclose the lists for your use. No doubt other lines will follow the lead of the Great Eastern.

"In order that the public may save the expense of conveyance of small returned empties, light and inexpensive boxes for use once only will be on sale at all stations on and after December 1, 1895, on the following terms:—

No. 1 ...	SIZE.			Price Each.
	Ins. (Length)	Ins. (Breadth)	Ins. (Depth)	
.. 2 ...	10 $\frac{1}{2}$	7 $\frac{1}{2}$	3	1 $\frac{1}{2}$ <i>d.</i>
.. 3 ...	13	9	4 $\frac{1}{2}$	2 <i>d.</i>
.. 4 ...	15 $\frac{1}{2}$	10 $\frac{1}{2}$	5	2 $\frac{1}{2}$ <i>d.</i>
.. 5 ...	16 $\frac{1}{2}$	11 $\frac{1}{2}$	5 $\frac{1}{2}$	3 <i>d.</i>
.. 6 ...	18 $\frac{1}{2}$	13	6	4 <i>d.</i>
.. 7 ...	21 $\frac{1}{2}$	14	7	5 <i>d.</i>

"Commencing on December 1, 1895, as an experiment, farm and market garden produce will be conveyed to consumers by passenger-train from numerous stations specified:—To London and stations in the Great Eastern suburban district, at a reduced charge of 4*d.* for 20 lb., and 1*d.* additional for every 5 lb., or part thereof, up to 60 lb., including delivery within the usual limits. These rates will only apply subject to the following conditions:—1. That the produce shall be packed in the boxes on sale at the different stations, or similar ones. 2. That the boxes shall be secured by nails, and not by rope or cord. 3. That the produce shall be conveyed at owner's risk, and the carriage prepaid; the prepayment being made by parcels stamps on sale at the stations. 4. That no box shall be of a greater weight than 60 lb."

You will see by the enclosed list how far this company has already gone in these directions, and doubtless the other main lines will speedily follow the lead—mayhap, better the example of the Great Eastern.

Another point of great practical and pocket importance is again briefly touched upon by Mr. Monro. "Apples carefully papered and packed in non-chargeable boxes in this way will make from ten to twenty-five per cent. more than in bushel baskets, with the result that every fruit reaches the consumer's table in perfect condition, instead of there being a considerable proportion too much damaged to ever reach the consumer at all." I think there is little more to be said. That little, however, is said with great force in the figure 2*d.*—the price charged for tissue-paper to wrap each Apple of a bushel in separately. But the labour—well, that abounds in rural homes, and few occupations would afford more pleasure or a more profitable technical education to the children than the careful handling and packing of choice fruits, such as Apples. But the grand feature of the new tariff is that distance does not count nor tell. All parcels of the same size and weight pay the same charges over the wide areas included in the new tariff of the Great Eastern, and this will probably be so generally adopted and extended as to give us a uniform rate throughout Great Britain and Ireland. The latter, with sweeping reductions and extensions in our parcel-post—sufficient, at least, to raise the latter to the level of the service rendered by the Governments of France and Germany—might do a great deal to revive our drooping agriculture, and give a useful filip to our advancing horticulture.

The Chancellor of the Exchequer might do far worse with the handsome surplus left him by his predecessor than pay the post-office pensioners off with it, and reserve the revenue thus saved to the reduction of the charges and increasing the efficiency of the parcel-post to the public at large. And thus the post-office and the railways, with co-operative collections as well as production and distribution, might bring growers and consumers into as speedy and cheap communication as possible. D. T. F.

A GROUP OF IRIS XIPHIODES.

THIS handsome bulbous plant has long been popular in our gardens, being of easy culture, and very hardy. A native of the French and Spanish Pyrenees, it has been in several varieties in cultivation in England for nearly 300 years. The plant has an ovoid bulb, glaucous linear leaves, the lower 1 foot in length; spathe two to three-flowered; pedicel shorter than the spathe; the limb 2 to 3 inches long, violet purple in the type; the falls have an orbicular blade 1½ inches broad, generally yellow-coloured in the middle; standards oblong, more than 1 inch high. There are many varieties differing more or less in their colouring. *I. xiphioides*, or English bulbous Iris, flowers in July in this country, that is, after the less variable *Iris xiphium*, or

does very much the same as before, and is heard to remark that no good comes of meddling with Providence. In a similar way the forester receives much advice regarding the right species to plant, and at periodical intervals the discovery of some arboreal novelty in some out-of-the-way or distant part of the world (usually Japan) is announced, which in the opinion of experts, will prove a valuable substitute for the one or other of our native timber trees. Considering that the latter are easily propagated and grown, are comparatively safe from climatic vicissitudes, and are appreciated by timber buyers, it will be readily understood that the discovery of these distinguished foreigners is hailed with the greatest satisfaction by economic tree planters, and after they have withstood fifteen or twenty degrees of frost without being killed outright, are confidently recom-

situation. When this species was first introduced, and extensively planted by the Duke of Atholl, and its good qualities brought to the notice of British planters, many thought it utter nonsense to plant anything else, and thousands of acres were planted with it alone in every conceivable soil and situation, so that it probably occupies more recently-planted ground at the present day than all other species put together. What the result has been, most people know. In suitable localities it has fulfilled all reasonable expectations, and in such is still regarded with the highest favour. In other districts it will scarcely grow into poles, and hardly repays the cost of planting. Its failure in these districts is almost universally attributed to the Larch disease, and foresters are eagerly looking either for a remedy for the disease, or for a disease-

FIG. 23.—GROUP OF SPANISH IRIS, AT THE YEW, CAMBRIDGE.

Spanish Iris of gardens, is past. It is an admirable border plant, doing well in moist, deep, sandy soils, and where these conditions exist in the neighbourhood of water, it is a capital subject for forming groups. It may also be employed in positions that entail annual removal if the bulbs can be left in the ground till the foliage matures. The subject of our illustration (fig. 23) consists of a group of a white variety growing in Mr. H. M. Tighe's garden at The Yews, Cambridge.

FORESTRY.

OUR TIMBER TREES.

EVERY now and then the distressed agriculturist is solemnly assured that his salvation from ruin hangs upon the cultivation of a particular crop, or the adoption of a particular system of farming. In spite of these valuable hints, however, the farmer still

mended for re-foresteing Ireland and the highlands of Scotland, or the Welsh hills. An old Scotch saying runs, "There's nae folk like oor ain folk." We believe this expression is regarded in a complimentary light, and if so, we might apply a similar compliment to our trees when the question of planting a profitable crop of timber is under consideration, although few planters appear to share the same opinion. Introductions of gigantic dimensions are pointed to as undoubted evidence of their suitability for our climate, and their rate of growth is compared with that of indigenous trees, to the detraction of the latter. But granting that certain species can grow as quick again as Oak, Elm, or Scots Pine, what better off are we unless the net value of the timber of the former is higher than that of our native trees. So far as Larch is concerned, no one doubts its superiority as regards rapidity of growth and quality of timber over most of our common plantation trees, so long as it finds a congenial soil and

resisting Larch. It would be as near to the mark to blame the judgment of the planter for its non-success as the Larch disease; but as the latter does not appear to mind it, this is of no great consequence. The disease, *per se*, is no more harmful than dozens of other parasitic diseases which we rarely hear mentioned, though common enough. There is probably scarcely a single plantation of Larch in the United Kingdom which does not also contain *Peziza Wilkommii*, the only difference being that where the conditions are favourable to the healthy growth of the trees the disease keeps in the background; where the conditions are unfavourable, the disease spreads rapidly, and gets the upper hand. We have been informed that the disease is unknown in Ireland. Why so, we cannot say. In St. Patrick's time neither Larch nor disease was there, so it could not have been banished with the toads and snakes; and as he probably never heard of its existence elsewhere, he could scarcely have left instructions re-

garding its subsequent dismissal. We should imagine that something in the soil or climate encouraged the growth of the tree to such a high degree that the disease was unable to gain a footing, as it seems scarcely credible that affected plants or spores of the disease have never been introduced. With a little more care and judgment in choice of sites, the Larch may still be grown successfully in this country, but we might as well expect a Zulu or Hottentot to thrive in a cold climate merely attired in his native costume, as expect an Alpine tree to succeed in our peculiar climate when unfavourably situated and in bad or unsuitable soil. *A. C. Forbes.*

#### FORESTRY INSTRUCTION IN SCOTLAND.

A Scotch correspondent writes:—"The report made by Mr. Munro Ferguson, of Novar, M.P. for the Leith Burghs, to the Royal Scottish Arboricultural Society, deals with an important question. The suggestion that Government be asked to establish in Scotland a state forestry school is not a novel one, but the fact that Mr. Munro Ferguson's report, backed as it is by the unanimous support of Scottish arboriculturists, has got the length of being now under the consideration of the Board of Agriculture, is most satisfactory, and a point gained. Another matter that should be kept in view is that, were the State to grant a subsidy for the purpose of teaching forestry in Scotland, their doing so would not form a precedent. It may be remembered that a sum of £45,000 was given by Government to a company formed by the late Mr. Parnell for emigration and afforestation purposes in Ireland in 1884. The money, unfortunately, was entirely lost, as the scheme was not gone about as it might have been. There is more hope for the Scotch scheme, and Scotland has a very good claim for aid from Government for forestry education. Another favourable aspect of the case is the large breadth of land suitable for afforestation, but meantime waste, abounding in the Highlands of Scotland. The experiment of starting a forestry school would not cost a great sum; indeed, the estimate is made that for about £300 or £400 of an annual outlay, a very efficient school could be run. We have only to look at the success which has attended the experiments of our continental neighbours in this respect to lead us to take a leaf out of their book. Mr. Munro Ferguson's scheme will cost about £30,000 or £40,000, but the rental of the land is expected to cover the interest upon capital expenditure. The area of land to be acquired must have a certain proportion under timber. This will make the instruction given in the forestry school of real utility, so that the teaching of the manufacture of timber will be carried out along with teaching in planting, and in the care of young plantations. Great expectations are entertained among Scottish arboriculturists of the assistance likely to be given the movement by the Highland and Agricultural Society of Scotland. This society's co-operation in the scheme is to be asked, and will no doubt be cordially given. All that is now required is a favourable consideration of the scheme by Government, and then Scotland will have a long felt want supplied. *A Correspondent.*

#### RULES FOR JUDGING.

HAVING dealt in a former article with this subject on general principles (see p. 140), we may now proceed to discuss it in detail and from the point of view of Exhibitors and Judges.

In the preface, on p. 4, the paragraph commencing "Too great stress, &c." contains in a condensed form the whole pith of the matter; the accompaniment in the way of suggestions to societies being the best part of the whole. Following on come the "general rules," which are pretty much the same as those adopted by all well-managed societies. Too much emphasis cannot be laid on Rules 7, 14, 15, 16, and 17, which (see Rule 12, which bears on the Royal Horticultural Society acting as referee in cases of dispute) will not always work satisfactorily, for it must be a patent fact that

to settle such disputes one needs to be on the spot in order to arrive at a just and equitable decision. Rule 3, which pertains to "kind" and "variety," fails to cover every case. The better way is to drop one or the other, and let the common-sense view obtain. For instance, say "Class —. Collection of vegetables, distinct kinds," and there let the matter rest, adding the number of dishes, of course. We do not see that any useful purpose is served by any farther addition, unless, as we have suggested, before that the word "sort" be used to indicate minor variations. Old exhibitors and judges, however, know full well that duplicate dishes of Potatoes, &c., do not add points.

Suggestions to schedule-makers form the next section, and it begins with about the best advice that can be given, viz., "State clearly at what hour exhibitors can begin and must finish staging." This rule is more honoured in the breach than in the observance, and it results in enquiries being made of the judges as to how much longer their work will last when the subscribers and others are waiting to inspect the exhibits. The suggestions as to the allocation of the prizes is also to the point. The 22nd paragraph suggests at its conclusion that "judging will be conducted under the Royal Horticultural Society's 1896 Code of Rules," but it should be distinctly stated where that Code is to apply. It might be better to put it thus: "The judges to use their own discretion in making the awards, the 1896 Code of Rules being at their disposal for the settlement of doubtful points."

At 28, examples are given, as we have already mentioned, of how collections of fruit and vegetables should be stated in the schedule. The first is that of a "collection of twelve dishes of ripe fruit, not less [fewer] than six kinds, nor more than two varieties of a kind." This could be considerably and more clearly condensed to "collection of twelve dishes of ripe fruit, distinct kinds (black and white Grapes admitted)." "Not less [fewer] than six kinds" is not essential; it would be impossible to have fewer than that number when "two varieties of a kind" is the limit. The third is that of a "collection of six distinct kinds of vegetables; only one of the Cabbage tribe [genus] may be included." We cannot conceive why an exhibitor should not be allowed to stage two such high-class vegetables as Cauliflowers and Brussels Sprouts in a collection of six dishes. One is a white vegetable, and the other a green one, but as both are bracketed under 73 under the head of Cabbage family [], between which and "Cabbage tribe," as quoted above, there is no difference. We assume what is really meant is, that Brussels Sprouts and Cabbages could be staged, but the other view is decidedly conveyed. (In collections of vegetables it should be made compulsory to stage each dish intact, not divided into two, as some exhibitors stage in order to make the entire exhibit of uniform appearance). Examples of what to avoid call for no comment; such as those quoted would rarely occur, save from gardens of limited capacity.

Suggestions to judges: Paragraphs 29 to 33 may be dismissed in a few words. Some of the hints therein given seem to indicate that the judges know little or nothing about their business. Where such advice is essential the men employed must be positive greenhorns at their work. Paragraph 33 says, "Judges should not disqualify without a substantial reason," quoting in support paragraphs 3, 7, and 8, to one only of which we will allude—Would five Peaches be a substantial reason for disqualification when six were intended, or forty-nine Cherries when fifty were required? If paragraph 7 be interpreted absolutely, the missing Cherry must cause a disqualification when the judging is performed (?) under the 1896 Code. Paragraph 33 is certainly suggestive, it should never be made compulsory to interpret "dish" in its strict meaning. The numbers of fruits to each dish is good (see paragraph 41), save in large collections of Apples or Pears, as in the case of say 100 dishes, five fruits then are sufficient (the Royal Horticultural Society adopt this number themselves). In every schedule

the number or the weight of fruits of a dish should be stated.

Passing on to paragraphs 45 and 46, we note some more good suggestions as regards quality and colour. The example given of "Alexandra Noble Peach" as a case in point, where colour does not count, is a good one, but judges who know fruits do not need to be told this bit of information; nor do they require to be told at par. 48 that "malformed fruit, spots, insect marks, bruises, decay, and want of stalks or eyes, are defects."

At 50 the pointing of fruit is dealt with, the numbers of points allocated to each kind on the whole being good, but a few alterations might certainly be made; for instance, Muscat Hamburg and Madresfield Court Grapes are worth quite as much in pointing as Muscat of Alexandria; whilst, on the other hand, such as Gros Maroc, should never receive so many points as Black Hamburg. Flavour as found in the latter should outweigh the larger berries, denser bloom, and oftentimes larger bunches of the former. Flavour should most certainly carry weight in the case of Grapes, but it does not always obtain. For this reason some exhibitors grow such as Gros Maroc to come in early, simply from the point of appearance.

Why Apples are to receive 7 marks as the maximum, and Cherries only 5, requires some explanation. Gooseberries instead of having 5 would have been well provided for with 3 marks. The time of the show should also have an important bearing on the number of points, e.g., Cherries, Figs, Plums, and Strawberries, early in the season should point relatively higher than when shown later on. From 52 to 66 the hints are decidedly more applicable to the exhibitors than the judges, otherwise they are to the point, but contain nothing new. The restriction as to the size of Melons is taken too low, 21 inches in circumference would be better as the maximum—this will not then allow of quite 7 inches diameter.

During the season of flower shows, it will happen that one important meeting follows quickly on the preceding one. Grapes are thus made to do duty twice, but the experienced eye will soon detect the shrivelling stalks; of this fact, no notice is taken.

#### JUDGING VEGETABLES.

From paragraphs 67 to 108 vegetables are dealt with, the room occupied being in excess of what is needed, viz., over six pages. (Fruits only occupy four pages.) These have been grouped, as in the case of fruits, under one heading, and then a repetition of each kind, with the points to each. Given 74 to 106 inclusive, the exhibitors or the committee could do the work of judging themselves. There is a redundancy of adjectives used in these paragraphs; for instance, at "84, Cauliflower, of medium size, firm, solid, rounded, free from stain and frothiness." (?) A smaller number of marks would have sufficed for Jerusalem Artichokes, Beet, Beans (Broad and Longpod), Beans (Runner and Dwarf Kidney), Cabbages, and Vegetable-Marrows, as contrasted with Peas, Onions, Carrots, Asparagus, Mushrooms and Celery, i.e., five marks for Beet as against seven for Peas, five for Vegetable-Marrows to seven for Asparagus, and so on. At 68 it states "Quality, coupled with a size suitable for table use;" then at 106 it goes on to say, "Vegetable-Marrows of medium size, about 1 foot in length." For cottagers' produce even this is too much, to say nothing about gardeners' classes. Surely judges should know this without any code. And, moreover, there is a loss rather than a gain in mere individual size, the energies of the plant being misdirected in its attainment.

In this section, again, no note appears to have been made for additional marks for forced vegetables. It would also have been interesting to have had the circumference given against Onions, the monster examples of which, as shown by some exhibitors, are mainly intended for seeding purposes, and not for actual consumption.

From 109 to 121, specimen and other plants are treated on; the remarks on specimen plants and

Orchids are concise and to the point. As regards the latter we are glad to see that made-up plants are absolutely discouraged. Under the heading of Begonia it would have been as well to have added the word "tuberous," it was evidently intended.

Proceeding to table plants the old mistake is made of allowing 6 inches diameter as the maximum size of pot, whereas  $4\frac{1}{2}$  inches is quite sufficient.

"Table decorations" at 124 starts well by saying, "No hard-and-fast rule can be laid down, as table decoration is so entirely a matter of individual taste." It goes on to say, "When fruit has to be taken into account, six more points may be added." What for? Arrangement or quality?

Respecting hand-bouquets in the following paragraph, it says they "should not be so large as to be cumbersome," &c. No better advice could be given. The following remarks, too, are more for the exhibitor than the judges. This paragraph finishes with good advice also (exhibitors take note). "Ferns or other garniture placed on the table as an adjunct to epergnes, are to be removed by the judges prior to adjudicating," and quite right too; this refers to epergnes and vases.

Groups of plants follow, the advice being that in practice by the best known exhibitors. In the pointing for groups, "general finish" has four points, and "elegance and beauty of arrangement" six. Where the latter is complete, the former must of a necessity be so too. General finish being an essential of the other.

Roses are treated upon from 127 to 147, the rules being both concise and to the point. We note with pleasure that dressed blooms are discouraged, the reflexing of the petals (outer) of Teas and others of similar shape has of late years been practised by some exhibitors. Further on it gives the ideal of an exhibition pot Rose as "The plants should be pyramidal or round." Will our well-known exhibitors note this?

Chrysanthemums are treated upon from 149 to 159 (about four pages), under respective heads, the lines followed being those usually adopted, the whole being readily understood. The suggestion at the end being excellent as regards the addition of foliage plants to groups.

Hardy plants and flowers have a section to themselves, commencing with annuals. At 165 "Hardy Perennials" are described, shrubby plants being included therewith. To save any confusion here, the better way would have been to advise that the words "Hardy Perennials" be never employed in the drafting of schedules. Further on, "It is strongly recommended that in the framing of schedules the simple words, 'hardy flowers,' should be adopted," this meets the case. Three simple headings for hardy flowers would have been:—1st, Annuals and Biennials; 2nd, Herbaceous; and 3rd, Shrubby Plants (i.e., those with woody or permanent growth). Instead of "excluding Lilies and other bulbs, corms, and tubers," it would have been better to add them to hardy herbaceous plants, making it clearly understood that they might be included, otherwise Lilies, &c., might be shut out entirely, with no special provision for them.

We note that the "building up of bunches" is discountenanced, and rightly so. At 176, instead of saying "twelve bunches of hardy flowers, distinct kinds, or distinct varieties," why not say, not more than two of one genus? The number of points suggested should work out well.

Various flowers are treated upon from 178 onwards. These chiefly consist of florists' flowers, commencing with the Auricula. The definitions given are to the point with no superfluous descriptions. An opportunity was afforded to have made the suggestion under "Carnations" that paper collars be dispensed with, but it does not appear.

Where sectional judges are employed the application of Rules for Judging might be referred to, but in exhibitions where one set of judges do all the work, its application would involve more time than is usually allowed for the performance of the work.

## TREES AND SHRUBS.

### TREES AND THEIR GROWTH.

"ONCE more I send you my annual measurement of trees, girthed at 4 feet from the ground. As before, the tree which grows most rapidly is the great pollarded Spanish Chestnut; its growth of 2 inches a year is all but constant. It will be noticed that fourteen trees are measured, of these one-half grow 1 inch or more a year. The quickest growers are the two Spanish Chestnuts (both old trees), and the Cryptomeria and Wych-Elm (both young ones)."

Wm. Wickham.

"Binsted-Wyck, Jan. 17," in *Hampshire Herald*.

### THUJA ORIENTALIS ZUCCABINIANA.

Amongst small-growing, neat-habited, and bright-foliaged, shrubby, or rather pigmy Conifers, this is one of the best, and there are many purposes to which it may be applied, especially in grounds of limited extent. The branches are numerous and slender, forming a dense, globose mass, and thickly furnished with bright green foliage, which colour it retains throughout the year. It has the cheerful, pleasing shade of green for which the plant is justly remarkable; and this, coupled with the neat outline and ease of culture and propagation, should tend to its increased cultivation. A. D. Webster

## FOREIGN CORRESPONDENCE.

### DOMBEYA WALLICHII (LINDL), BENTH, AND HOOKER.

THIS beautiful flowering tree, synonymous with *Astrapæa Wallichii*, Lindl., is in blossom at the present time in the Palm-house at the Botanic Gardens, Zurich. The plant is some 18 to 20 years old, and this is the first occasion of its having flowered. It is accommodated in a tub. The leaves are cordate, of about 1 $\frac{1}{2}$  feet in length and breadth; the flowers appear in the axils of the leaves, and in stalked pendent umbels, and of a bright scarlet colour; the anthers of a golden-yellow colour add considerably to the beauty of the blossom. The umbels on this plant measure from 6 to 8 inches across. It is a plant well worthy of cultivation in large stoves, being of graceful habit, and not difficult of cultivation, thriving in a compost consisting of two-thirds good fibry loam and one-third peat. It requires abundance of water during the summer months; and in winter, although it does not need so much moisture, it must not be allowed to get very dry, else the leaves flag and drop. Propagation is by

means of cuttings put in sandy soil, or in good bottom-heat under a hand-light or bell-glass. *H. F.* [*Dombeya Wallichii* was introduced from Madagascar in 1820, and is figured in the *Botanical Magazine*, t. 2503, from a plant growing in the Horticultural Society's Gardens, Chiswick. It used to flower every year in the Botanic Garden, Oxford. Ed.]

## THE GREAT FROST OF 1895 AT KEW.

THE effects of a severe frost on a garden cannot be estimated immediately. Species which at first sight seem irretrievably injured recover in the most surprising manner, or at any rate send up a new growth from the roots. It is prudent, therefore, not to be hasty in either cutting-in or removing plants which seem to have been more or less killed. On the other hand, some which at first sight seem little injured subsequently succumb. Nor is it easy to predict beforehand how any given species will stand the ordeal. In a large collection a severe winter affords many subsequent surprises. Plants which ought to be tender prove unexpectedly hardy; others which ought to be hardy turn out very much the reverse. But the results of no one winter can be taken as absolute; they are largely dependent on the amount of heat which the plants have experienced in the preceding summer. Where the wood has been well ripened, they will stand an amount of cold which under other circumstances would be fatal.

At the end of the summer succeeding a severe winter it is possible to estimate the mischief which has occurred. This has now been done at Kew, and the following notes give the results. The labour of compiling a list showing the effects of the frost on individual species would have been greater than any useful result which could have been derived from it. A brief review has only, therefore, been attempted in general terms. The period of severe cold began on January 26, when the minimum temperature taken in the screen fell below freezing-point, and never rose above it till February 22. During this period a series of extremely low minimum temperatures on the grass was recorded. On January 23, 15°; January 29, 10°; February 7, 1°; February 8, 2°; February 9, 3°; February 12, 5°.

An extreme minimum seems usually to occur every winter between Christmas and the early part of February. The peculiarity of 1895 was its repeated occurrence during a period of nearly a month.

Before placing such remarkable temperatures on record, it seemed desirable to check the performance of the instruments used by comparison with the observations taken at the Kew Observatory (Richmond), which is situated in the Old Deer Park and to the south-west of the Royal Gardens.

Mr. Chree, the superintendent, was so good as to take out the lowest temperatures observed at the Kew Observatory from 1888, and in the following table these are compared with the temperatures recorded for the same dates at the Royal Gardens. It will be seen that the two series are fairly accordant, especially for the later years.

LOWEST READINGS FROM MINIMUM THERMOMETER ON GRASS.

Year.	Date.	Observatory.	Royal Gardens.
1888	February 2	° Fahr. 14.1	° Fahr. 10
1889	February 13	8.8	2
1890	December 23	7	4
1891	January 10	9	8
1892	December 27	9	9
			(Feb. 17, 6.5)
1893	January 5	7	7
1894	January 5	11	11
1895	February 8	0	2
			(Feb. 7, 1)

From the gardening point of view, the effect of the prolonged low temperature would operate in two ways. Trees, and woody plants generally, would be liable to be killed by the freezing of their stems and branches. But these, and herbaceous plants generally, would have also to encounter the effects of the prolonged freezing of the ground surrounding their roots. The sub-soil of Kew is for the most part a scarcely coherent sand, which retains little moisture. It was, however, frozen throughout to a depth, in one case under a gravel path, of 2 feet 10 inches; under grass the frost penetrated much less, probably only to an average of 20 inches. The fate of the immense and valuable collection of bulbs which had been planted out in the preceding autumn was a matter of the greatest anxiety. On the whole, though all must certainly have been frozen, the loss was less than might have been expected. The destruction of Alpine plants by cold at first sight seems paradoxical. But it must be remembered that in the Alps they are covered by a deep and warm investment of snow, which they rarely receive in England.

Besides the fate of the collections in the open air, the supply of water to those under glass, of which there are 2½ acres, was an even greater matter of anxiety. The Royal Gardens fortunately possess their own waterworks, which are supplied directly from the Thames. The use of this water for drinking purposes is, however, prohibited by law. The drinking fountains, official residences, and those belonging to the Crown, including Kew Palace, are therefore supplied by the Southwark and Vauxhall Company. On February 6 the supply from this source failed, and was not finally restored till April 30 following. For some days no drinking-water was obtainable in the whole parish. It is entirely due to the indefatigable exertions made by Mr. Justin Allen, the resident assistant clerk of the works, that a similar disaster did not befall the water service of the Royal Gardens. The mains, of which there are some miles, extend to the high level reservoir in Richmond Park. By the continuous use of steam power the water in these was kept in motion, and in no single case did it freeze. By the aid of the official fire brigade the cisterns of the residences were kept filled, the consumers being warned that the water must be boiled before being used for drinking purposes. *Kew Bulletin, January.*

(To be continued.)

## VEGETABLES.

### ON PREPARING LAND FOR ONIONS.

THE Onion is a gross feeder, and succeeds best in a rich, deep, heavy loam. For the main crop, land should be trenched in the autumn. If the bottom spit is unfit to make a satisfactory seed-bed, it is not desirable to bring it to the surface, and in such cases, bastard trenching should be adopted. During trenching, a heavy dressing of decayed farm-yard or stable-manure should be applied, and that from cow-sheds is best for light soils, while stable-manure answers better for tenacious land. The soil should be left rough on its surface, so that it may be the better pulverised by frost, and thus improved for the reception of seeds. Once the soil is sufficiently frozen to bear a barrow, a dressing of gas-lime of about one barrow-load to each perch of land may be given, for apart from any manurial properties, it is beneficial in checking injurious insects. During February, apply a coating of soot, which will assist the young plants to make a vigorous start, and also militate against many insects. It is said to be particularly helpful in preventing the ravages of the Onion-maggot. Here, however, we are singularly free from this destructive pest. Land prepared as above, and provided the weather is favourable, will be in good condition for sowing early in March. For seed sowing a dry day must be chosen. Roughly break the soil by driving it with rakes, and then draw off any rough stones, &c., and leave a fine even surface. If the ground has become

aked by heavy rains during winter, it is best to chop it over with hoes before driving it. The drills should be shallow, and about one foot asunder. The work may be done neatly by drawing, sowing, and covering each drill separately, and before another one is begun. By so doing there need be no treading upon the drills, and this is an advantage in the case of heavy soils, especially if at all wet. Very light soils may with benefit be made firm by treading before sowing, as this gives the plants a firm rooting medium, and also hinders rapid evaporation during dry seasons. Seeds sown upon very heavy land should be covered with finely-prepared soil, such as sifted refuse from the potting bench.

Good useful Onions can be produced from land which has been heavily manured for preceding crops of Peas or Celery, &c., and although the bulbs thus cultivated are not usually so large as are those that have heavy dressings of manure specially applied for the crop, they are invariably firmer, and keep better than large quickly-grown bulbs. We have, however, on heavy land, experienced some difficulty in getting Celery plots after in good tilth early enough for Onions, owing to it being trod, and the soil moved in all kinds of weather in winter, and we do not now attempt it. *T. Coomber.*

## THE WEEK'S WORK.

### THE FLOWER GARDEN.

By HEDLEY WARREN, Gardener, Aston Clinton, Tring.

**PROPAGATION, ETC.**—The propagation of bedding plants should be proceeded with, and the growth of such stock plants as Verbenas, Cupheas, &c., encouraged by placing the plants in heat, so as to produce good cuttings. Half-hardy annuals that require to be raised in heat should now be sown. When the seeds have germinated, admit air freely on every favourable opportunity, but avoid damp and currents of cold air. Carnations and Pinks which have been wintered in cold frames should have the lights removed from them when possible, so that the plants will become thoroughly hardened, before they are planted out in their permanent quarters. The latter operation may be effected shortly if mild weather continues. Calceolarias, Pansies, Violas, Pentstemons, Antirrhinums, &c., require to have their points pinched out, so that a bushy, starchy habit may be induced. *Lohelia cardinalis* and its varieties, now in hoxes, may be divided and potted up, still giving them cool treatment. Do not over-pot the divisions, but at the same time allow sufficient root-room to produce a strong growth. White Everlasting Peas may be increased by dividing the roots which are now becoming active. As a border-plant, it is one of the best and most useful.

**HERBACEOUS PHLOXES.**—Although autumn is the proper time for the propagation of these useful plants, they may now be increased by dividing the old roots, which are starting into growth. If divided now, they will flower satisfactorily during the coming season. Or a few roots may be placed in heat, and when the growths are of sufficient length, take them off and root singly in thumb-pots in a hot-bed or warm house, and gradually harden off; but so treated, the plants are of little service for flowering until the second season. After planting Phloxes, give a good mulch of rotten manure, as being surface-rooting plants, they are much benefited by this, the roots being kept cool and moist, as well as stimulated.

**ACACIA LOPHANTHA**, a graceful plant for dotting in beds with an undergrowth of some dwarf bedding plant, may be used in various combinations, and generally with a pleasing effect. Seed of this species should now be sown in small pots, placing one or two seeds in each, having previously soaked the seeds, which are very hard, in water for twelve hours. Plunge the pots in bottom-heat, and the seeds will soon germinate; and when re-potting the plants, take care to disturb or injure the roots as little as possible. The seedlings may be kept in the warm frame in which they were raised, till re-established, and then come into a less warm place, and be kept growing freely, but not allowing them to become spindly or very long jointed, or much of their beauty will be lost. In May they may come into the greenhouse, and in early June into the open

air. *Grevillea robusta*, *G. rosmarinifolia*, *Eucalyptus globulus*, and *E. citriodora* require similar treatment.

**HUMULUS JAPONICUS** (Japanese Hop), is a useful plant for covering garden arches and arbours, and the seed of this plant may now be sown, or roots obtained and planted.

**MUSA ENSETE** AND **M. SUPERBA** are noble, showy-looking plants, of use in sub-tropical bedding and as isolated specimens in sheltered warm nooks. The plants are propagated by suckers and seeds raised in heat.

**HINTS ON MISCELLANEOUS OPERATIONS.**—The planting, transplantation, and pruning of deciduous trees and shrubs should now be completed as quickly as possible. The lawns, turfed verges, &c., should be kept tidy by the use of the besom and roller, when the surface is dry enough to permit their use, and all binding gravel walks should be rolled when the surface is not in a clinging condition. A mulching of leaf-mould or peat-moss litter may be afforded beds of hardy Azaleas, Kalmias, and other flowering shrubs, having previously lightly stirred the surface. Beds of the border Carnations may also be afforded a dressing of leaf-mould and wood-ashes, or burnt garden refuse, with a little soot and bone-meal added. This sort of dressing materials incorporated with the soil used for layering greatly facilitates the rooting of the layers. Carnation layers which may have been potted in the autumn of 1895 will have made plenty of roots, in some cases filling the pots, and preparations should be made for transplanting them into beds in the open towards the end of the present month, or in March. In preparing the ground for their reception, it should be dug to a good depth, dressed heavily with rotten manure, and, if possible, a good dressing of old mortar may be applied. [Salt is an excellent manure for Carnations, Pinks, &c. Ed.] Afford protection to Tea and other tender species of the Rose, should hard weather threaten, and for this purpose dry bracken or stable litter is excellent. It should be laid aside when the frost lifts.

### THE ORCHID HOUSES.

By W. H. WHITE, Burford, Dorset.

**ÆRIDES AND SACCOLABIUMS.**—The favour with which the *Odontoglossums*, *Cattleyas*, and *Dendrobiums* are regarded has been the means of consigning other species of merit, as *Ærides* and *Saccolabiums*, to a deserved neglect. These beautiful Orchids, when well grown, present finer racemes of beautiful fragrant flowers than the former. Some amateurs discard them on the plea that the plants do not make satisfactory growth, and to some extent this is true, but with a suitable house, and a suitable position in the house, they will in time be found to adapt themselves to the cultural method pursued. On this subject many useful hints may be learnt by visiting collections where *Ærides* and *Saccolabiums* are successfully grown, carefully noting the position the best-grown plants occupy. It is not necessary to have the plants in a division apart, as the temperature maintained in the East Indian-house is suitable for most of them. The chief things to guard against are irregularity of temperature whilst growth is being made, a draughty position, insufficient light, and letting the plants carry their flowers a long period of time. The following varieties may be grown in the East Indian-house, viz., *Ærides Houlletianum*, *A. Lobbi*, *A. suavisimum*, *A. Larpentei*, *A. odoratum*, *A. Savageanum*, *A. Fieldingii*, *A. virens*, *A. expansum*, *A. quinquevulnerum*, *A. crassifolium*, *A. Jansonii*, *A. Lawrencei*, and its variety *Sanderianum*. From the present time till the end of the month is a suitable season for examining the condition of the plants as regards the rooting medium, drainage, &c. The roots of the plants, whilst soft and growing, are easily injured, turning black at the tips on the least bruise. Each plant should at this examination be thoroughly cleaned, the operator being very watchful of scale, which is bad to eradicate when it gets established, and low down in the axils of the leaves. Handle the plants carefully so as not to split or break down the leaves, or a valuable specimen may be spoilt for years to come. Properly-cultivated *Ærides* do not require re-potting every year, but only when they require more rooting space, or when the plants are in poor condition through loss of the foliage. The exhausted materials should be carefully picked out, and clinging roots detached without bruising or breaking them. A plant which has lost its lower leaves, if there are plenty of roots coming

out up the stem, may have the base of the stem removed, so that when the plant is placed in the new pot, the lowest leaves will be raised just above or on to a level with the rim; then place the plant in the middle of the pot after putting a few large crocks at the bottom, place as many of the lower roots in the pot as can easily be got into it, being careful not to crack them, and work in an upright position amongst them crocks of a moderate size, which will have the effect of letting the water pass quickly away. The drainage should be brought nearly up to the rim of the pot, the whole being finished off with clean picked sphagnum-moss and small crocks in about equal proportions pressed down moderately firmly. To each growth, put a strong neat stick to support it. The plants so treated should then be protected from strong sunshine, one thorough watering afforded. The sphagnum-moss on the surface will probably soon show that it is dry, and may then be slightly sprinkled with water through a fine rose pot.

### THE KITCHEN GARDEN

By C. HERRIN, Gardener, Dropmore, Maidenhead.

**SHALLOTS, GARLIC, AND POTATO-ONIONS.**—These bulbs may be planted as soon as the surface of the ground is sufficiently dry and workable. Shallots being largely consumed in most establishments, should be planted in quantity, and as the large variety of Shallots is not generally liked in the kitchen, the old small form should be that cultivated, and some of the Giant varieties grown for exhibition only. Plant Shallots at 9 inches apart each way, pressing them firmly into the bottom of shallow drills, and covering them level to the neck with the soil. Garlic requires the same distance, and to be put 2 inches below the soil; and Potato-Onions a little deeper than Shallots.

**LETTUCE.**—Owing to the continued mild weather, autumn-sown plants are making rather free growth, and there will be no scarcity of salading this season. In view of the sharp frosts which usually occur during this month and next, some of the largest may be lifted with a good ball of soil attached to each, and stood close together, in a cold frame, and protected in some manner. The plants are now unusually tender, and liable to succumb to a few sharp frosts accompanied by cold winds.

**FORCING ASPARAGUS AND SEAKALE, ETC.**—Continue to put into heat roots in sufficient number to maintain a regular supply of heads, and as they force readily at this season, not so many as formerly will be needed to do this. In lack of a more convenient place for forcing Asparagus, a bed of well-sweetened stable-litter and tree leaves, about 2 feet in depth, may be introduced into any vinery started about a month ago. Cover the surface of the bed with 1 inch of leaf-mould, on which pack the roots closely together, and cover them with a small quantity of a light kind of soil, or with leaf-mould, packing it pretty firmly around and between them. A small supply can be kept up for a few weeks in this way. Seakale roots may be forced on a mild hot-bed in the Mushroom-house, made in a kind of cupboard or bin, as previously advised. A few roots of Chicory may be placed in the receptacle at the same time. If other materials should run short occasionally, a very fair salad may be made from the blanched leaves of Chicory and Mustard-and-Cress. Seeds of the last two plants should be sown at frequent intervals in small shallow boxes, and placed in a warm house. All tubers of the Jerusalem and Chinese Artichokes remaining in the ground at this date may be lifted and stored in a cool place, selecting the necessary number of sets from the medium-sized and best-shaped tubers. The white Jerusalem is an improvement on the old variety, for besides being better flavoured, there is less waste in its preparation for table, owing to its more even shape. If a fresh piece of ground cannot be spared for Artichokes, the land on which they grew should be deeply dug or trenched, after well dressing it with manure. The planting of the tubers need not take place for a few weeks, for, although quite hardy, I have always found that the plants, if good sets be used, will give large returns if planted early in the month of March.

**FRENCH BEANS.**—Where heated pits will shortly be available for French Bean culture, time may be saved by sowing at this date, in large-sized 60-pots, three or four seeds in a pot, and getting them on in readiness for planting in the pits two or three weeks hence. At Dropmore, one side of a low span-roofed house (used afterwards for Tomatoes) is utilised, and

the Beans planted out in a bed of soil. Previous sowings of Beans should be well syringed once a day at the least; and even in cloudy weather this should not be neglected; and if a full crop of pods has been obtained, weak liquid-manure should be employed at each alternate watering. A minimum temperature of about 65° should be maintained.

**OUT-OF-DOORS MUSHROOM-BEDS.**—The open weather has been favourable for Mushroom-culture, provided the beds have had sufficient internal warmth and the right kind of protection used for them. I find that beds and ridges produce excellent Mushrooms in the months of April and May, and I am commencing to collect stable manure for making into beds in about three weeks from this date. The longest straw is shaken out of it, and the fresh droppings are added to the straw obtained from that which was prepared earlier in the year, and the whole is mixed up together every morning, and made into a conical heap to ferment and sweeten.

### PLANTS UNDER GLASS.

By JNO. MCINTYRE, Gardener, Woodside, Darlington.

**THE HIPPEASTRUM (AMARYLLIS)** is one of our most gorgeous flowering bulbous plants, but is not so generally grown as it should be. Bulbs of the finer varieties are expensive, but cheap ordinary varieties are useful for cut flowers, &c., and well worth cultivating. A stock of these may be obtained by procuring each year a packet of seed from a good source. These will flower the third year, and if seedlings are thus annually raised, the best can be selected when in flower, and the rest discarded. In the course of six or eight years, by such means, a very choice collection can be acquired. If named varieties are purchased however, much time is saved, and there will be no disappointment in the quality of the flowers. Amaryllis should be partly shaken out of the old soil annually, and repotted in the same size pot, assuming they are flowering bulbs. The compost may consist of two parts good rich fibrous loam, one part cow-manure in a thoroughly dried state, one part leaf-soil, and a sprinkling of coarse Reigate sand. Potting should be done at once. A part of the collection may be retarded for succession. To start the first batch a gentle bottom-heat, if available, is best, but good results may be obtained in its absence. Give them a moist atmosphere at a temperature of 70° to 75°. The moisture in the house, together with a moderate spraying overhead with the syringe will suffice for some time after repotting, but as the plants make more roots, an increasing supply of water will be necessary. A liquid solution of cow or sheep-droppings is the best stimulant for Amaryllis.

**ALLAMANDAS.**—If one or more specimens are wanted early for exhibition purposes, and the plants are grown on balloons, select one or two that were rooted early, and remove them to the warmest part of the stove. Spray the plants overhead with the syringe twice a day, and afford water at the roots. As soon as there are signs of growth, cut the plants hard back, and repot or top-dress them, as the case may require. Allamandas flower more freely if not given too much root-room; limit, therefore, the size of the pot according to that of each plant. Specimens sufficiently large for show purposes can be well done in 16-inch to 18-inch pots. Should they, during the latter stages of growth, show signs of weakness, this can be overcome by frequent applications of liquid-manure. In potting, use good loam two parts, leaf-soil one part, and coarse Reigate sand one part. They may be given the driest position in the stove, as spider or thrip rarely attack the plant, and it will flower more freely if not grown in too moist a position.

**FUCHSIAS.**—Part of the stock of these which was dried off in autumn, should now be moved into a moist atmosphere of about 50° to 60°. As soon as the young shoots break, prune and re-pot the plants, and grow them rapidly for early use. From plants started a good batch of cuttings should be taken; and if these are struck, and grown on quickly, they will make nice half-specimens, which will flower well through the autumn. Specimens for exhibition in May and June should now be started also. Fuchsias delight in a rich light compost, such as two parts loam, two parts leaf-soil, one part spent Mushroom-manure, and one part good river-sand.

**THE FORCING-HOUSE.**—From a dozen to thirty plants of Azalea mollis should be moved into a warm house each fortnight. The stock of imported clumps of Spiræa should now be put in heat. A vinery or

Peach-house will suit them until shade becomes too dense. Lilacs, Staphyleas, and Deutzias, should be introduced into heat at intervals, also Hyacinths, Tulips, Narcissus, and other bulbs. It will be difficult to retard Hyacinths for exhibition purposes late in spring, as the weather has been unusually mild, but all possible means to such end should be used. Cold pits, having a north aspect, where the plants can be fully exposed when weather permits, both day and night, are suitable, for all from which it is necessary to exclude frost.

### FRUITS UNDER GLASS

By W. POPE, Gardener, Highclere Castle, Newbury.

**EARLY-RIPENING MELONS.**—The plants which have been raised since the beginning of the year, will be large enough to be placed in their fruiting-pots, or planted out on hillocks if they are to be grown in this way. It will be advisable to mix a small quantity of leaf-mould with the loam, which itself should not be of a very heavy kind. Before planting the Melons, make the soil as warm as that of the bed in which the plants are growing, or a serious check may be given. If the plants are to go into a Melon-house, it is well to plant them rather thickly, i.e., about 1 foot apart along the front when the length of rafter for training is about 8 feet; and each alternate plant should be stopped on reaching the trellis, and the others encouraged to grow half-way up the roof before stopping or allowing lateral growth to form. A longer succession of fruit is assured by this method, and the entire trellis is occupied by bine instead of, as is usual, the lower half. Afford the plants as little water as this stage as is consistent with healthy growth, especially being careful not to let much moisture touch the stems at the collar, or canker may result. The night temperature may range about 70°, and the bottom-heat 85°, a little air being afforded daily, according to the state of the weather, and on fine afternoons lightly syringe the plants with tepid water. Plants intended to run over the surface of the bed in pits or frames should be pinched at the second or third rough leaf, either before or after planting them. Put a wheelbarrow-load of soil in the middle of each light, to form a hillock on which to plant, making it firm and flat at the top. When the Melon-roots are seen at the outside of the hillock, more warmed soil should be added to it. Slugs must be watched for, and a ring of dry soot or lime placed round each plant as a safeguard. The frames should be shut up early in the afternoon with sun-heat, after damping the surface of the bed with tepid water through a fine rose water-can. Seeds may be sown for succession.

**CUCUMBERS** should also be put into their fruiting quarters as soon as large enough, and as they will require much the same kind of treatment as Melons, little need be said except that the soil may be lighter and richer, the base of it being fibry loam, to which some old mortar and charcoal may be added. Manure is best applied in the form of liquid later on.

**STRAWBERRIES IN POTS.**—Where the earliest crop is set, the temperature may be raised to 65° at night; and water applied as often as it is required, with occasionally some weak liquid-manure. Thin the fruits to ten or twelve of the largest and best formed, or a smaller number if they are wanted extra large in size. Plants which have not set their fruit should be kept at 50° to 55° at night during cold weather when much artificial heat is required, or they will fail to set their flowers satisfactorily. On the first appearance of aphides the pit or house should be fumigated, and always before the flowers open a fumigation should take place. Fresh batches of plants should be put into warmth at intervals of two or three weeks, according to requirements. A slight top-dressing of Thomson's Vine-manure stirred lightly into the surface is very beneficial to the plants when they begin to throw up their flower trusses.

**TRANSLATIONS.**—These are, as we all know, rather dangerous things, and it behoves those who live in glasshouses, as we do, to avoid throwing stones. It is with no such mischievous object, however, that we note the following, taken from a French book on the culture of the Vine. Gros Colman, we are there told, is very subject to a terrible disease, the "Shan King," of the English. It was some time before we recognised that shankiog was meant!

## EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

## APPOINTMENTS FOR THE ENSUING WEEK.

## MEETINGS.

SATURDAY,	FEB. 8—	Royal Botanic Society meet.
SUNDAY,	FEB. 9—	Brussels Orchidéeenne meet.
TUESDAY,	FEB. 11	Royal Horticultural Society's Committee, Show, and Annual General Meeting.

## SALES.

MONDAY,	FEB. 10	Azaleas, Palms, Gladioli, Carnations, &c., at Protheroe & Morris' Rooms.
TUESDAY,	FEB. 11	Carnations, Hollyhocks, Tigridias, Iris, &c., at Protheroe & Morris' Rooms.
WEDNESDAY,	FEB. 12	Lilies, Tuberoses, Spireas, Paeonies, Begonias, &c., at Protheroe & Morris' Rooms.
THURSDAY,	FEB. 13	Roses, Palms, Greenhouse Plants, Lilies, &c., at Protheroe & Morris' Rooms.
FRIDAY,	FEB. 14	Hardy Perennials, Pansies, Clematis, Pinks, Roses, &c., at Protheroe & Morris' Rooms. Great sale of Imported Orchids, from Messrs. F. Sander & Co., at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—39° 1'.

The Royal Horticultural Society.

BEFORE our next number is issued the annual meeting of the Royal Horticultural Society will have been held. Special interest attaches to it by reason of some recent actions on the part of the Council which, though doubtless prompted by excellent motives, were so maladroitly carried out that they are likely to excite animated controversy.

The Report of the Council has been published and circulated for some weeks (see p. 89), so that the Fellows will have had an opportunity of perusing it. On the face of it, it is a very clever and innocent-looking document. Whether some other complexion may not be put upon some portions of it will be seen on the 11th.

The Report opens with an allusion to the recently-issued Code of rules for judges. This is a work for which the Society deserves and will receive the warm thanks of those concerned, in spite of errors and inconsistencies inevitable in such publications, and which, moreover, can readily be corrected in future issues.

Of Mr. BARNON'S retirement we may say that the memory of his unrivalled services, and of his splendid faithfulness and loyalty during the dark ages of the Society, will not soon be forgotten by the gardening community. The Council does no more than justice to Mr. BARNON in the few sentences devoted to him. It did very much less than justice, even supposing that such retirement was desirable, in the manner in which it effected

his "retirement," but a handsome pension and a life Fellowship show at least that no personal indignity was really intended.

Of the Committee appointed by the Council to visit and report on Chiswick surreptitiously, not a word is said in the Report; let us hope because the Council feels that it did collectively what individually it would have scouted.

Mr. S. T. WRIGHT, the new Superintendent, comes to Chiswick with an excellent record, and we earnestly hope the Council will in all practical matters allow him, as they say they will, "a perfectly free hand." The alleged plan for the future conduct of Chiswick is, as everyone expected, still *in nubibus*. What Chiswick is, and what it should be, are points often discussed in our columns. We allude to the subject now with a feeling of dread that the recent proceedings on the part of the Council may be but a prelude to the eventual abandonment of Chiswick, on the ground that it is too unproductive, and expensive to keep up. It may be so. It must have been so during the last few years, when almost the entire series of glasshouses and pits, including the big vinery, have been put into such substantial repair, that only two old houses, whose doom has, we believe, often been pronounced by the Chiswick Board, but never carried out by the Council, now remain.

To judge Chiswick solely from the financial standard is utterly to misapprehend the functions of such an institution, and of the proper work of the Society. Whether more effective work might not be done there for the same expenditure is altogether another matter, and one we have often alluded to; but, at present, the Council has, they tell us, no ambitious programme, and has simply replaced one excellent gardener by another excellent gardener.

The abolition of the Chiswick Board is not an event to be regretted. To call gentlemen, many of whom were also members of Council, from many miles in the country to recommend the expenditure of so many shillings on brooms or flower-pots was a waste of power, more particularly when, as we believe often happened, the Council ignored the recommendations of the Board.

The endeavour to encourage individual research and importation is a new feature, and one which we hope may lead to good results, though we should have been better pleased had the Society itself taken up this work at Chiswick. As it is, not a single meeting is to be held at Chiswick this year, in spite of the fact that the Chiswick Conferences have been decidedly among the most valuable work done by the Society.

Only a sum of £120 has been received for the Lindley Library Catalogue Fund—a sum quite inadequate for the purpose, and which, we fear, is likely to cause further delay.

Nothing is said about the generally expressed opinion that the Society should take a much more active part in the provinces than it has done lately. The failure of some of the provincial shows need not deter the Society from taking steps to weld the local societies into one great federation, with the Royal at the head. There are divers other ways in which the Society could keep in touch with provincial horticulturists, to which we may refer later on.

The only other point to which we would call attention at present is the election of new members of Council. The Fellows have really this matter in their own hands, and if they do not exercise their rights, it is no wonder the Council does so for them. We would urge upon the Council the desirability each year, *en temps utile*, as the French say, of reminding the Fellows of their duties and privileges, and of the

proper time of exercising them. As things now are, when the Fellows rouse from their usual apathy, it is to find that they are too late.

Gardeners will lament the retirement from the Council of their representative, Mr. OWEN THOMAS, and still more the circumstance that no representative gardener is to fill his place. Mr. McLACHLAN ought, from his long experience of societies, to be very serviceable, and as a representative of the Scientific Committee will command the respect due to his attainments and character.

That amateurs, especially those who occupy themselves with valuable original research, should be admitted to the Council is most desirable. It is also desirable that the term "amateur" should be rigorously defined, and that the commercial element and the amateur element, both of the highest importance to the Society, should be kept separate and not confused.

It is impossible to forecast the result of the meeting. So far as we know, there is no organised opposition to the council's proposals, but we have unfortunately reason for knowing that there is in some quarters, especially in the provinces, a revival of a feeling of distrust, and in some cases of bitterness, which has been in abeyance since the migration from South Kensington. As the welfare of the society is the common bond which unites all sections and heals all wounds, we trust that all secondary, and especially all personal matters will be set on one side, and every effort made to increase the usefulness and influence of the Society.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Royal Horticultural Society will be held on Tuesday, February 11, in the Drill Hall, James Street, Westminster. It is expected that a new system of glazing will be brought before the committee by a gentleman from Jersey. At 3 o'clock, the annual general meeting of the Society will be held in the Lindley Library, 117, Victoria Street, S.W.

ROSE SHOW FIXTURES IN 1896.—The following list of Rose shows for the current year is kindly furnished by Mr. EN. MAWLEY, Rosebank, Great Berkhamstead, and will be added to as occasion requires: "June 17 (Wednesday), York (three days); 18 (Thursday), Colchester; 24 (Wednesday), Reading (N.R.S.); 27 (Saturday), Windsor; 30 (Tuesday), Sutton; July 1 (Wednesday), Croydon and Ealing; 2 (Thursday), Eltham, Gloucester, and Norwich; 4 (Saturday), Crystal Palace (N.R.S.); 8 (Wednesday), Redhill (Reigate); 9 (Thursday), Helensburgh; 15 (Wednesday), Uiverston (N.R.S.); 21 (Tuesday), Tibshelf; August 5 (Wednesday), Chesterfield. The above are the only dates definitely fixed that have as yet reached me. I shall be glad to receive others as soon as arranged, for insertion in my next list."

ROYAL INSTITUTION.—Professor H. MARSHALL WARD, F.R.S., Professor of Botany in the University of Cambridge, will begin a course of three lectures on "Some Aspects of Modern Botany," at the Royal Institution, on Thursday next, February 13.

BOTANICAL MAGAZINE.—The plants figured in the February number are:—

*Begonia unbrauculifera*, Hooker, f. t. 7457.—A Brazilian species of tall stature, leaves stalked, reniform, destitute of scales; flower-panicles stalked, forked, much branched; flowers about 1 inch in diameter, whitish. Sir JOSEPH HOOKER remarks that this species and *B. frigida* are the only ones that produce occasionally structurally hermaphrodite flowers, but the development of such flowers in the cultivated tuberous *Begonias* is now common.

*Scutellaria formosana*, t. 7458.—A Formosan plant, with stalked ovate leaves, and terminal racemes of purple flowers, described by Mr. N. E. BROWN in *Gard. Chron.*, 1894, ii., p. 212.

FIG. 21.—FLOWER PARTERRE, WITH CLIPPED SHRUBS, ASCOTT, LEIGHTON BEZZARD. (SEE P. 106.)

W. H. R. B. 1896

*Sternbergia macrantha*, J. Gay, t. 7459.—The finest of all the *Sternbergias*, differing from *S. lutea* in its larger size, longer perianth tube, whilst the leaves are produced in spring instead of with the flowers in autumn.

*Hechtia argentea*, Hort., t. 7460.—A very striking Bromeliad, with numerous densely-tufted, long, narrow, spine-margined, silvery leaves, and terminal leafless flower-spikes, with small tufts of white flowers at intervals near the end of the spike.

*Bifrenaria tyrianthina*, Reichenbach, f., pseudo-bulbs ovate, three-sided, pitted, with a single leaf; flowers 3 inches across, sepals oblong, obovate, lilac; petals similar, smaller, paler; lip spurred, convolute, front lobe projecting, velvety, purple, hairy.

**KEYNSHAM DISTRICT HORTICULTURAL ASSOCIATION.**—The annual general meeting, as we learn from the *Bristol Mercury*, of the Keynsham and District Horticultural Association, was held on Tuesday evening, Jan. 28, at the Baptist School-room, Mr. R. FRICKLIN (president) presiding. The report gave evidence that last year's show was a marked success in every way. The entries numbered 1003, as against 921 the previous year, and there was a balance of £2 7s. 4d., as against a withdrawal of £9 4s. 8d. from the reserve fund in 1884. The president, who is about to leave the neighbourhood, tendered his resignation, and the election of officers then took place. Mr. T. T. MITCHELL being elected president.

**"DICTIONNAIRE PRATIQUE D'HORTICULTURE ET DE JARDINAGE."**—The forty-fifth *livraison* of this valuable work has now appeared, the editors having arrived at the letters Oro—. As the entire Dictionary will consist of eighty parts more than half of it has now been published. The publisher is M. OCTAVE DOIN, 8, Place de l'Odéon, Paris.

**THE ROYAL GARDENERS' ORPHAN FUND.**—The usual monthly meeting of the committee took place at the Horticultural Club on the 31st ult., Mr. W. MARSHALL in the chair, there being a large attendance of members. The minutes of the last ordinary and a special meeting having been read, the chairman called attention to the great loss the fund had sustained by the death of the president, Sir Julian Goldsmid, Bart., M.P., and moved the following resolution, which was carried unanimously: "The Committee of the Royal Gardeners' Orphan Fund desire to express to Miss Goldsmid and the other members of the family of the late Sir Julian Goldsmid, Bart., M.P., the President of the Fund, their deep sense of the great loss sustained by the Committee and supporters of the Institution through his lamented death. They desire to record their highest appreciation of the eminent services rendered to the Fund by Sir Julian Goldsmid during the period of his presidency, and tender to the family of the late president their respectful sympathy and condolence." The following special donations were announced: Mr. J. H. Wallace, sale of flowers at the Bristol Chrysanthemum show, £5 5s.; Reigate Chrysanthemum Society, per Mr. R. E. West, £5; Leeds Paxton Society, per Mr. R. E. Edwards, £2 18s. 6d.; Tonbridge Gardeners' Society, per Mr. G. Fennell, £3 2s. 6d.; and a sum of £9 15s. 10d. from other sources. A draft report and financial statement of a satisfactory character was submitted by the secretary and adopted for presentation at the annual meeting. A very hearty vote of thanks was passed to the chairman for his services to the Fund during the past year, and suitably acknowledged by Mr. Marshall.

**THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.**—If the contributors to these pages who find fault with the working of the charity will give it a thought, they will see that even those men who have paid their guinea a year for fifteen or twenty years, take out, if they should chance to become necessitous and come on the charity, as much in the first year as pensions as the total amount they have paid in. Hence, then, come the funds to pay the pensions of succeeding

years, if they do not come out of the pockets of the charitable supporters of the institution—the monied ladies and gentlemen, not all of them connected with horticultural pursuits—who have combined to help the gardeners who will not or cannot contribute to its funds in sufficient numbers to make it a strong, rich body? If the gardeners would join in large numbers, the funds would be so greatly increased that the necessitous members would be admitted to its benefits on application after the necessary investigation of their claims for consideration had been made. Until that day arrives it must comport itself as a benevolent institution, with all the usual safeguards which its limited funds demand.

**NATIONAL CHRYSANTHEMUM SOCIETY.**—To the special prizes offered for collections of vegetables at the Jubilee Exhibition of the above Society, to be held in November next, given by Messrs. JAS. CARTER & Co, Messrs. E. WEAB & SONS, Messrs. DOBBIE & Co, Messrs. W. W. JOHNSON & SON, and Messrs. T. HARRISON & SONS, all of which appear in the preliminary schedule of prizes lately issued, can now be added the following from Messrs. SUTTON & SONS—fifteen distinct varieties of Potatoes; and for two dishes, one each of Sutton's Supreme and one of Windsor Castle, in each of which valuable money prizes are offered. This promises to be one of the most extensive and interesting exhibitions of vegetables held in London in recent years.

**THE EALING GARDENERS' ASSOCIATION** held their usual weekly meeting on the 28th ult. Mr. J. HUDSON, Gunnersbury House Gardens, spoke upon "Conservatories: their Design and Arrangement." It was rightly suggested that owners of gardens should consult their gardeners in respect to the erection of structures for the growing of plants as a means of avoiding common but disastrous mistakes. Conservatories were occasionally erected on unsuitable sites, being between two dwelling-houses with blank walls around them, lofty, and with no means of ventilating the sides. A lantern roof was recommended as the best to employ. A conservatory should be as fully adapted to the growing of plants as were ordinary plant-houses. Other valuable hints were given upon the importance of using good glass, and upon the best methods of heating, and a remark made that conservatories were sometimes badly heated because dependent upon the apparatus connected with the mansion. The construction of the floors, doors, and other particulars were dealt with, and afterwards Mr. HUDSON gave descriptions of the best methods of arranging the plants in the structure, of the use of rockwork in suitable places, and other matters.

**SHEFFIELD CHRYSANTHEMUM SOCIETY.**—The annual dinner was held on Saturday evening, at the Masonic Hall, Surrey Street. The President (Mr. C. E. JEFFCOCK) was in the chair, who stated that the society was in a flourishing condition, that the membership was increasing, and that the shows were improving.

**FEMALE GARDENERS.**—When Parliament opens, the list of questions that the responsible ministers will have to face is quite appalling. Questions relating to Armenia, Venezuela, Transvaal and Siam naturally take first rank, but one question which is to be put by one of the representatives of an agricultural district is sure to cause some amusement. It appears that the "New Woman" has invaded another sphere hitherto reserved to the so-called sterner sex, i.e., gardeners, and that Mr. TRISELTON DYER, of Kew Gardens, has engaged two ladies, who have passed examinations qualifying them for competency in this field of labour, on condition that they adopt masculine attire at the magnificent remuneration of 10s. per week. It is reported that hundreds of ladies have applied for appointments, but their applications are held in abeyance in order to see how the appointments turn out. The question to be asked is:—If it is against the law for men to adopt female attire, why is it legal for women to adopt male attire? [The ladies are technically "boys."] *Southampton Echo*.

**ROYAL HORTICULTURAL SOCIETY OF ABERDEEN.**—A special meeting of the acting directors of this society was held on Friday evening, the 31st ult., in the office of the Secretary, Mr. A. M. BYRES, C. A., to consider a proposal that the society should hold a Chrysanthemum show. The meeting, in view of the possibility of a financial loss resulting from such an undertaking, decided that the proposal should not be entertained.

**CHESHUNT, WORMLEY, AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.**—At a meeting of this society on the 30th ult., Mr. JOHN WRIGHT, F.R.H.S., delivered a lecture on "Grapes and Apples." Commencing with the last-named, Mr. WRIGHT made the usual protest against so much fruit being sent to England from other countries when it ought to be grown at home. In the case of large growers, only a few sorts should be planted, but these in large number. In the case of the cottager or amateur, he should suggest planting a larger number of varieties, but few of each. Planting was then described and illustrated. In regard to manuring, one of the most essential points was a knowledge of the trees' requirements, so as to apply to the soil only that which is deficient. After describing standard, bush, and cordon trees, the lecturer showed by diagrams the proper and improper methods of pruning, with their respective results. In enumerating a select list of the best varieties to cultivate, Mr. WRIGHT gave, for cooking purposes Manx Codlin, Stirling Castle, Lane's Prince Albert, Bismarck (these are compact growers, and suitable for small gardens), Lord Groevener, Lord Suffield, New Hawthornden, Potts' Seedling, Newtown Wonder, Warner's King, Bramley's Seedling, Peasgood's Nonsuch, and The Queen. For dessert, by far the best is Cox's Orange Pippin, a few others being Worcester Pearmain, Lady Sudeley, King of the Pippins, and Blenheim Orange. All the varieties enumerated were illustrated by beautifully-coloured drawings.

**EPHING FOREST.**—The Epping Forest Committee of the City of London Corporation on Saturday issued a report of their year's work. After referring to the reports of the experts appointed by the Corporation to inspect the work of the committee, as a further vindication of their policy and action, they state that they propose to thin, to a moderate extent, over a somewhat large area, an arrangement in accordance with the views of the experts in regard to the portions visited by them. They have also resolved to plant one or two strips in the neighbourhood of Bucknare Hill and Loughton. Work has been found in the forest for the unemployed, the roads and drainage in portions of it having been greatly improved. A museum has been established in Queen Elizabeth's Lodge by the Essex Field Club, for the purpose of illustrating the natural history and archaeology of the forest parishes. The exhibition includes geological specimens, stone, and bronze implements, Romano-British pottery, fungi, forest mosses, flowering plants, insects, mollusca, snakes, lizards, and amphibia, and a complete collection of the eggs of birds known to have nested in the forest, with a series of wood-cuts of all the species. There are also maps, views of the forest, geological sections and plans, and the whole forms a very interesting collection. The forest continues to be extremely popular as a place for the recreation and enjoyment of the public. *Times*.

**WINCHESTER GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.**—A meeting was held on the 28th ult., in Great Minster Street. Before the usual business was commenced, the chairman, Mr. MAYO, said he had a very pleasant duty to perform; it was to show the appreciation of the members to the honorary secretaries, Mr. LOWNS and Mr. BROOMER, by the presentation to each of a marble timepiece, voluntarily subscribed for by the members of the association. Mr. FOULKE, B.Sc., M.R.A.S., then delivered a lecture (under the auspices of the Hants County Council) on "Insects injurious to plants," which was illustrated by lantern slides, showing the different

stages of insect life. Mr. FOULKES, wishing it to be more of an introductory lecture, dealt with the formation of insects, their weak points, mode of breathing, and ways of attacking trees and plants—in some cases sucking the juices, in others eating the foliage—and the rapid manner of reproduction, especially the green and black aphids. Mr. FOULKES also described the parasitic way in which one insect killed another, showing that what might at first appear to be an enemy, was in reality a friend. In the next lecture, Mr. FOULKES will treat on "Insecticides and Washes."

**SUNDERLAND GARDENERS' SOCIETY.**—A meeting of the members of this Society was held on January 30, at the Café, Fawcett Street, the chairman (Mr. J. T. RICHARDSON), presiding. Mr. JAMES WATSON (Sea View) read an excellent paper on the culture of hard-wooded and soft-wooded Ericas, dealing with their propagation by seeds and cuttings, the best time for striking both varieties, soils, peat, and manure for their proper culture, the treatment of young plants, careful watering and drainage so as to secure success, and their treatment in general, and gave names of the best eighteen hard-wooded and seven soft-wooded varieties. Mr. USHER (Somerton) will read at the next meeting a paper on the culture of the *Azalea indica*.

**DINNER OF THE BRADFORD PAXTON SOCIETY.**—The annual dinner of the members took place at the Market Tavern Hotel on Thursday, the 30th ult. The president (Mr. J. SPENCER) was in the chair, and there were about ninety guests. The secretary (Mr. W. WILKINSON) read the report for the past year, showing that the membership continued steadily to increase, the present number being eighty-four. Commenting on the papers read and lectures given during the past year, it was stated that they had embraced many instructive and interesting subjects. Several excursions to gardens in the neighborhood had also been made during the summer months; the annual excursion being to Harewood House. The statement of accounts showed a small balance in hand.

**HYBRIDS.**—As showing how hybrids are ousting pure-breds, we may mention that on a recent visit to the Orchid-house at Kew for the purpose of comparing some species of *Cypripedium*, we found that although there was a fair quantity of hybrids still in bloom, the pure species were relatively very few, this is unfortunate for many reasons, and now that crossed *Cypripediums* have become as common as florists' flowers, it is to be hoped our botanic gardens will make a point of continuing to grow the original species.

**SNOWDROPS** form one of the special features at Kew just now. They are to be found in thousands, mostly of the larger kinds, such as *G. Elwesii* and others. When seen in such large quantities they have a milky appearance, which renders the name *Galanthus*, Milk-flower, specially appropriate.

**OVERHEARD IN THE PLEASURE GROUNDS AT KEW.**—"Lor! I don't think much of this; it's just like our cemetery!"

**SARDA MELONS.**—The December issue of the *Kew Bulletin* contains a note upon this fruit, ripe specimens of which were forwarded to Kew from Kabal by Dr. AITCHISON. The seeds were distributed to several public and private gardens, and from the Royal Gardens, Frogmore, a fruit raised from one of them was forwarded to Kew by Mr. O. THOMAS, who wrote: "I send a small fruit of the Sarda Melon for you to taste. The flavour, I think, sweet, and very refreshing. I shall certainly grow this Melon again, and use it to cross with other varieties." The fruit, it is added, measured 10 inches long and 7 inches in diameter; the skin was yellowish-green and netted, the wall of flesh 2 inches thick, and rich in flavour, as well as sweet and juicy. Dr. AITCHISON pointed out, in a note published in the *Kew Bulletin*, that the Sarda Melon does not develop its full flavour until it has been exposed to a low temperature, and then kept for a time.

**PINUS LARICIO VAR. SALZMANNI.**—This variety has hitherto only been found in France in two localities in the Cevennes; but recently M. FABRE has lighted upon a small wood of 70 to 80 hectares, where P. L. Salzmanni grows in a wild state at altitudes of 400 to 500 metres on coarse sandstone soil. The largest trees are 70 to 80 years old, and about 10 metres in height. The young trees also have a flat top, indicative of a struggle to adapt themselves to the condition in which they are placed. The variety cannot hold its own against the Pinaster introduced about 1840. It appears to be a survivor of the old pliocene flora of Lanquedoc, and is gradually dying out.

**THE SLUG WITH A SHELL.**—Occasionally we meet these creatures in our gardens, and he, or one of them, has been often figured in our columns. It appears there are three nearly allied species, the differences between which are clearly set forth and illustrated by Mr. W. M. WEBB, in the December number of the *Journal of Malacology*. The journal may be unknown to some of our readers, on which account it may be permitted us to allude to the careful way in which it is edited, and to the excellent manner in which it is got up.

**NOTICE TO CYCLAMEN GROWERS.**—Our Berlin correspondent informs us of his intention to send to us for exhibition at the Drill Hall on February 11, a box of cut flowers of *Cyclamen*, grown by Mr. TURBENTHAL, of Berlin. The season for *Cyclamens* in Berlin is from October till Christmas, so that the specimens sent will be from plants that have been for a long time in flower, and they will, moreover, have had a long journey, facts that will have to be allowed for in assessing the merits of *Cyclamens* "made in Germany," and alleged to be superior to the British race.

**SINGLETON.**—A fire broke out on Tuesday at Singleton Abbey, Swansea, and was not extinguished until the west wing of the house had been completely gutted.

**THE GARDEN IN RELATION TO THE HOUSE.**—A paper on this subject was read by Mr. F. INIGO THOMAS, at the Society of Arts, on Tuesday last. We shall have an opportunity of alluding to this later on.

**LEICESTER CHRYSANTHEMUM AND FRUIT SOCIETY.**—The annual meeting of this Society was held at the Victoria Coffee House, Leicester, on Friday, January 31, Sir THOMAS WEIGHT, the President, in the chair. The Hon. Secretary (Mr. R. G. LAWSON), read the committee's report, which stated that the series of monthly meetings which were commenced last year, had been continued, and some very interesting and instructive lectures were given. The annual exhibition was remarkable for the fine display of fruit. The Society was financially in a low condition, although they had reason to be gratified with the result of the past year's work.

**THE DOUGLAS SPRUCE SPAR AT KEW.**—The great flagstaff at Kew, which for the last thirty-five years has been one of the conspicuous landmarks of the Royal Gardens, has, during the past fortnight, been undergoing a thorough overhauling, and upon careful examination it was found to need substantial repair. The base was very much decayed, so that it was necessary to cut off several feet, and splice a new piece on of the same length. For this purpose the spar had to be taken down. The splice was successfully made and strengthened by five iron bands, and the staff again erected on Tuesday last. For the benefit of our readers who are not acquainted with this magnificent spar, the following description of it, taken from the official *Guide to the Royal Gardens*, will be of interest. This spar which is of Douglas Spruce (*Pseudotsuga Douglasii*), is believed to be the finest spar in Europe. It was presented to the Royal Gardens in 1861 by EDWARD STAMP, Esq., and was cut in the forests of British Columbia. Its total height is 159 feet, of which 12 feet are sunk in a ventilated bricked pit.

The age of the tree was about 250 years, and its total height 180 feet. A section cut from the base of the spar before its erection in 1861 is contained in the museum, and shows the closeness of the grain of the wood, having eleven annual rings to the inch.

**BIRMINGHAM AND DISTRICT AMATEUR GARDENERS' ASSOCIATION.**—This Association commences the new year under very auspicious circumstances. They have moved their place of meeting to a much larger and more suitable room at the Municipal Technical School, Suffolk Street. They have a larger balance in hand than any previous year, and their Hon. Treasurer (Mr. R. F. REES), and Hon. Secretary (Mr. W. B. GRIFFIN), have both been re-elected for the fourth time. If only they are supported by the amateurs in the district, the year 1896 will be far ahead of any of the three previous ones. At the annual meeting held recently, Mr. Alderman WM. WHITE, J.P., was re-elected president for the fourth year, and Mr. JNO. OLIVER was added to the list of vice-presidents. The secretary is Mr. W. B. GRIFFIN, Wychbary, Alcester Road, Moseley, Birmingham.

**BURRS ON THE GINKGO.**—Mr. KENJURO FUJII has obligingly sent us a reprint from his paper in the *Tokyo Botanical Magazine*, in which he describes and figures some singular outgrowths from the trunk of the Maidenhair tree. These have the form and appearance of roots such as are formed from the branches of the Banyan or Pandanus. The structure and development of the "chichi," as the Japanese call them, indicate that these bodies are masses of adventitious buds, similar to those masses which the Germans call "maserkrof."

**PITCAIRNIA CORALLINA.**—A fine plant of this gorgeous Bromeliad is now in bloom in the Victoria-house at Kew. It has tufts of lanceolate, plicate leaves, greyish on the under-surface, and with fine black spines at intervals on the margins of the petioles. The flower-stalk is about 1 foot or 18 long, and deflexed, procumbent, and bears at its summit a spike of exceedingly brilliant crimson-scarlet flowers, each more or less cylindrical in form, 2 to 3 inches long, and with the oblong segments margined with white or pale yellow. Not only the flowers, but the flower-stalk and bracts also, are brilliantly coloured. It was introduced from New Granada by M. LINDEN in 1870, and was figured in the *Revue Horticole* (1875), p. 321; and in the *Botanical Magazine*, t. 6600 (1882). The figure does not do justice to the plant, whose flowers are considerably larger than those represented.

**PRINTERS' CORPORATION.**—We are informed that an effort is being made by the Council of this corporation to raise a sum of £10,000, with which to permanently endow the Printers' Almshouses. The latest addition to the almshouses, which are situate at Wood Green, Middlesex, was opened by Her Royal Highness the Duchess of Albany, and Her Majesty the Queen and His Royal Highness the Prince of Wales have become patrons of the institution. The buildings present a pleasing elevation, being quite an ornament to the locality in which they are situated, and have been constructed to afford every comfort and convenience to the inmates. We have much pleasure in recommending the cause of this excellent institution, which has now been in active operation for nearly seventy years; and we have been asked to notify that contributions are urgently solicited and will be publicly acknowledged, and gladly received by W. Clowes, Esq., treasurer, Duke Street, Stamford Street, S.E.; F. J. E. Young, Esq., Chairman of Council, New Street Square, E.C.; or by J. S. Hudson, F.R.S.L., secretary, Gray's Inn Chambers, 20, High Holborn, London, W.C.

## PLANT PORTRAITS.

**ARANTHUS GRANDIFLORA**, Lindley, *Orchid Album*, t. 514.  
**LYCASTE SMEERANA**, Rehb. l., in *Gard. Chron.*, 1883, xx., p. 198. Supposed to be a natural hybrid between *L. Skinneri* and *L. Dippe*.  
**ODONTOGLOSSUM SCHLEPERIANUM VAR. FLAVIDA**, *Orchid Album*, t. 515.

## HOME CORRESPONDENCE.

**EARLY FLOWERS IN CORNISH GARDEN.**—The exceptionally mild temperature of the past three months has made our Cornish gardens very gay. Some autumn blooms linger on, and some spring blooms anticipate their natural season. The enclosed list gives some of the plants now flowering in Falmouth gardens in the open air without any kind of protection. I do not remember having ever before seen such a show of flower on January 31 in England:—

Abutilon megapotamicum	Godelia
" Darwini tessellatum	Grevillea rosmarinifolia (luxuriant)
" Crusader, Prince of Wales, &c.	
Acacia dealbata, 20 feet high	Helleborus colchicus
" species from Wynberg	" fœtidus
South Africa	" orientalis
	" trifoliatus
	" niger
	" species and variety
Almond tree	Hepatica
Alyssum saxatile	Hyacinths
Anemones in variety	Hydrangea hortensis
Antirrhinum	Iberis gibraltarica
Arabis grandiflora	" pruri
Arbutus	" sempervireas
Aubrietia Hendersoni	Iris reticulata
Benthamia fragifera (laden with fruits)	" stylosa, since December
Berberis Bealii	Jasminum nudiflorum
" Darwini	Kerria japonica
" species	Leptospermum baccatum
Box tree	Leucopoium vernum
Borago	Limnanthes Douglasii
Camellia, double white and red, in variety	Lithospermum prostratum
Campanula carpatica	Magnolia exoniensis
Chimonanthus fragrans, since December	Marguerites, in variety
Chionodoxa Lucilæ	Mariakolds
Choisya ternata	Miscumbryanthemum, species
Chrysanthemums in variety	Mycossette
Cistus brantemii	Myricotis
" africanus	Myrtus Cheken
Citron Madras (in bud and fruit)	Narcissus nana
Clematis balearica	" polyanthus, in variety
Colletia horrida	Olearia Gunniana
Corcepsia, since June	Pausies
Coronilla glauca, in luxuriant flower all the year round	Phlomis frutescens
" viminalis	Pittosporum Tobira
Crocuses in variety	Polyaotbus, in variety
Cyclamen ibericum	Primula, in variety
" Coum	Pyrethrum
" persicum	Pyrus japonica, and variety
Daphne laureola	Rhododendron Nobleanum, since November
" Mezereum	" hybrids, since November
Datura sanguinea	Ribes fuchsoides
Desfontainia spinosa, 6 ft. high	Roses, in variety
Diplopappus chrysophyllus	Silvia involucrata Bethelli
Doronicum austriacum (Harper Crewe's variety)	Saponaria, species
Edwardsia microphylla, flower-buds just bursting, 15 feet high	Saxifraga crassifolia, luxuriant
Eranthis byemalis	Schizostylis coccinea
Erica carnea	Scilla præcox
Eryugium pandanifolium	" sibirica
Escallonia in variety	Senecio Petasites
Eupatorium Weinmannianum, 7 feet high	Silene pendula
Euphorbia	Snowdrops since December
Ferula communis	Spirea, sp. double flowering species
Forsythia suspensa	Stocks
Fragaria indica, in fruit and flower	Tussilago fragrans
Fuchsias in variety	Veronica anomala
Genistas in variety	" Colensoi
Genitiana acaulis	" ligustifolia
Geranium phœnum	" Lyalli
	" salicifolia
	" hybrids and varieties
	" elliptica
	Viburnum Tinus
	Vines in variety
	Wallflowers

Howard Fox, Roschill, Falmouth.

**THE ROYAL HORTICULTURAL SOCIETY.**—It is much to be regretted that, so far, the sole response to my former communication (see p. 115) is the autobiographical lecture on p. 144 of last week's *Gardeners' Chronicle*, by the reverend nominee of the Council, under the usual "header," firstly, secondly, thirdly, and so on, the value of which will be duly appraised by the Fellows of the society. He chooses to construe my remarks in a personal spirit, as if the cap fitted; but nothing was further from my intention, and if the remarks are calmly read, no reasonable person will impute that fault to them. The preposterous assumption that "amateurs" are not fully—aye, over-fully!—represented on the Council will not bear a moment's scrutiny by any one who can read the list. The Council is composed of fifteen members, ten of whom are "amateur horticulturists," and five "practical horticulturists," the latter being men who follow the profession, and live by it. At the forthcoming election the Council propose to "retire"—one "amateur" and two "practical" horticulturists; and to substitute three amateurs! Is this what the Council of the Society, in its wisdom, considers to be fair play to practical horticulture? We appreciate amateurs (which may include every person outside of the profession) in their own part, which is a

secondary one in horticulture, as it is in divinity; but the Council of the Royal Horticultural Society appear to be inclined to give us a surfeit of them on the Council, whether professional horticulturists like it or not! We want men who are known and trusted in the horticultural world, and it is a mere matter of convenience and expense to themselves where they reside, in London, or at the farthest corner of the United Kingdom, if they regularly attend the meetings, and are willing to afford the costs. The blowing of one's own trumpet is a somewhat undignified performance, and however strong the temptation may be to retaliate, we can afford to pass by the uncomplimentary remarks about practical horticulturists. *Ne sutor ultra crepidam!* And let the Fellows of the Royal Horticultural Society see to it that too much of the amateur element is not infused into the council at the forthcoming election. We are still in ignorance of the purpose to be served in the issuing the "Balloting List for Council" to the Fellows of the society; but a policy of reticence is not calculated to advance the interests of the society. We therefore trust that the Fellows will attend the meeting on the 11th inst., and give their support to what is right and fair in the interests of horticulture and the future prosperity of the Royal Horticultural Society. *Horticultural Fellow of the R. H. S., Feb. 3, 1896.*

—As an old Fellow of the Royal Horticultural Society, I have noticed that of late years the Council has been of a somewhat composite character. Messrs. Douglas and Thomas represent the gardeners, Mr. Henry Williams the nurserymen, Mr. H. J. Pearson the hot-house builders. What we want on the Council are men with business capacities, and men above the suspicion of making capital out of their position; therefore, it matters little whether they are clericals or laymen, so long as they honestly forward the interests of the Royal Horticultural Society as a national institution. *Cultivator.*

**THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.**—I certainly uphold Mr. Bruce Findlay's opinions as stated by him on p. 116 of the *Gardeners' Chronicle*, that none but subscribers should be nominated as pensioners. I may mention that on several occasions I have asked my foreman and journeymen to join the Gardeners' Royal Benevolent, and the answer is, "What is the use of it? Members get nominated who have never paid one penny to its funds, and nothing but influence will get you elected." [This is not correct. En] Now, if the funds were sufficient to assist non-subscribers, the thing would be all right; but as the annual voting papers show there are more subscribers than can be elected, then why allow any non-subscribers to be elected? I believe in helping those that help themselves. Every gardener in the British Isles who is worthy of the name ought to be an annual subscriber of one guinea for fifteen years, and then every aged gardener in want could be taken as a pensioner without the anxiety and expense attendant on an election. *A Life Member.*

**ORIENTAL LILIES.**—In reply to the contribution of Mr. J. Mayne on p. 145 of the *Gardeners' Chronicle*, I write to say that the bulb of *Lilium giganteum* invariably exhausts itself in the production of its immense flowering stem. On the other hand, in accordance with what may be called the instinct of perpetuation, which in Lilies of every description is highly developed, it throws out offsets, of which even the largest takes from two to three years to build up a bulb equal in dimensions to that of their parent. *L. giganteum*, therefore, can only be expected to flower after an interval of growth and development such as I have indicated in my previous observations. But there is this consolation for the patient cultivator—that only under those conditions that the bulb has been growing steadily in the same situation for several years, does it ever reach its adequate height. If a flowering bulb of this unique Indian Lily, however imposing in aspect, is purchased from any of the great commercial horticulturists and planted in November, it may flower splendidly in the end of July, as it has done in my garden, but it will never reach a height of more than 6 feet. Probably the reason why your correspondent's *Lilium giganteum* survived the exacting ordeal of liquid-manure was, that it was applied at a comparatively early stage of its growth; when, as he confesses, it was only 3 feet high. Had he ventured to apply it at a considerably later period, when the flower-buds were forming, he would probably have found, like myself, that the element of ammonia which is powerful in

most applications of this nature, is disastrous in its effects. I am therefore strongly of opinion that if applied at all, it should be at a very early stage. This is also the opinion of one of the greatest of living authorities on the culture of the plants of Eastern climes—I refer to Mr. Harry J. Veitch, Eastern Lillier, as a rule, do not appreciate strong stimulants, which I have found fatal even to such vigorous varieties as *Lilium speciosum*, and several of my friends have discovered to be destructive of *Lilium candidum*; but I feel certain that much depends upon the special period of growth at which these are applied. Lilies, obviously, can never be regarded as dormant, so long at least as they are in the soil. They are, on the contrary, constantly engaged in the work of root-creation, and that of re-production; and I cannot but infer, from the fact of my own experience, that their bulbs are most entirely in correspondence with their immediate environments, when they are deeply imbedded in fibrous mould, strongly incorporated with innocuous peat and sand. *David R. Williamson.*

**A BOTANIC FICTION.**—In the current number of the *Quarterly Review*, p. 242, occurs the following statement: " . . . Sometimes, however, names were not entirely given out of compliment, and Linnæus himself set a bad example. He was so pleased with the humble behaviour of his friend, John Broll, that he named a plant *Browallia demissa*, and on Broll's elevation to the episcopate, he named a second species, *B. exaltata*. This did not please Broll, and he showed his wrath in so marked a manner, that when Linnæus discovered a third species, he named it *B. alienata*, and then the alienation was complete and lasting." Without exacting too high a standard from a *Quarterly Reviewer*, the public has a right to demand that the writer should have taken some amount of trouble to see that his statements were true. The article in question deals with several books on plant-names, and the first book on the list is the *Index Kewensis*. Had the reviewer opened the volume at the genus in question, he would have found that the three species in dispute were issued on the same page of the same book (*Syst. Nat.*, ed. x., p. 1118) in 1759, and that, therefore, this pretty little story is utterly baseless. A further trifling error of the reviewer is citing *B. elata* as "*exaltata*." The quarrel between Linnæus and Broll arose many years before these names were issued. *B. Daydon Jackson.*

**A TRADE GARDENER'S REQUIREMENTS.**—The letter that appeared in your issue for the 25th ult., under this heading, contained no queries but any practical man would ask when engaging a man. He requires a reliable person, and seeks full value for the return he will give. Now, I can say with some truth, there is many a master-man now struggling in this trade, who is doing more than the advertiser asks. Some of our leading men have been delighted in spare moments to do a bit of brickwork, or fashion a few so as to economise his heat more than a highly-paid bricklayer would do. In these tight times of cutting prices, trade-growers must economise or they cannot live. For instance, on the 28th ult., good English Safrano Roses at 1s. to 2s. a dozen; also Pink Roses, 1s. 6d. to 2s. do.; Lily of the Valley, medium, 3s. per dozen bunches; Tulips, white, 6d.; pink, 5d.; red, 4d., and other cut flowers equally cheap in a bad market. Such bad days at times run into weeks, and then all feel it, retailers included. As a close observer, I often think that many of our growers have to thank the street buyer for his existence, when one can see them spending their pounds against a struggling shopkeeper's shillings. Choice flowers, Orchids included, I have seen far better in Cheapside on sale than you would find in half-a-dozen City shops, excepting one establishment. *W. R.*

**TIMBER v. GAME.**—In reply to "S.," I repeat emphatically that competent keepers do not buy eggs. The fact of these and pheasants being advertised for sale, by no means proves that they are purchased by all or the majority of managers of game preserves. No doubt some owners and agents of estates still adhere to the old-time idea that little or no skill is required for the successful performance of a gamekeeper's duties. They appoint incompetent men to govern men equally unversed in the work, and then condemn keepers as a class, whereas the fault has been their own. Up-to-date employers know that "the square peg in the square hole" is the qualified man (and there are many such) at the head of this important department. "S.'s" statement, that egg-poaching is a lucrative busi-

ness, is a still further contradiction to his former assertion that game is scarce. Neither large numbers of early eggs could be gathered yearly by keepers, nor egg-stealing carried on to any extent, where game did not abound. Where it does abound, he is a clever poacher who can evade the vigilant watch kept upon the coverts and ground during nesting-time, so the business can only be termed lucrative in comparison to one extremely poor. I do not speak from theory, but from years of actual knowledge of facts. I know the present-day methods in detail, and can furnish records of the number of game reared and shot upon the extensive game preserves which would bear out my former statements, and would perhaps convince "S." that more is done by keepers than is dreamed of in his philosophy. *Game.*

**THE SWEET PEA CUPID.**—We have been much interested with the notice on "The Synchronism of Variation," on p. 83. It may be interesting to you to know that this same sport with a dwarf white Sweet Pea, appeared in a variety we had grown for us this season. We have saved the seed, and are testing it by the side of Cupid, received from Messrs. Atlee, Burpee & Co., for this purpose. The plant has been preserved, although somewhat damaged, and if you would like to see it, we should be pleased to send same to you. You are doubtless aware of the fact that Mr. Ernst Benary, of Erfurt, advertises in his catalogue this year the appearance of an identical sport. *Cooper, Taber & Co., Ltd.*

**EUCHARIS GRANDIFLORA AT GARNONS.**—May I inform your correspondent ("W. E.") p. 144, that the luxuriance of *Eucharis* at Garnons is no new circumstance. I remember, during my stay there ten years ago, how exceedingly well they did, and I have often been tempted to quote them on occasions when noting other's experience of the plants in the *Gardeners' Chronicle*. Your correspondent said they are quite free from mite and bug, and I think he might have gone further, and said there is not a bug on the place. At least, this was the case during the two and a half years I was there; and much of the credit is due to the head gardener at that time (Mr. Rowtree), who spared no pains to eradicate the pest. To this I attribute in large measure the excellence of the *Eucharis*. There is no need of the everlasting sponging and attendant breaking and bruising of the leaves, which is necessary where bug abounds, to say nothing of the injury caused by the pest. At the time I speak of, the plants were on the back stage of a three-quarter span-house, the front of which was used chiefly for East Indian Orchids, consequently a warm spot. They appear to be having about the same treatment as they received at that time; the only difference I notice is that peat was added in the compost, and this is an advantage, I think, although not a necessity. I believe the foliage assumes a much deeper green, and the soil is not so liable to clog when peat is added. They grew and flowered abundantly, seven and eight flowers on a spike, and I have seen nine. With regard to the mite, I have noticed it there, on plants which were put in a cold house, but all we did was to shake the bulbs out, and wash them in a solution of Fir-tree oil. They were afterwards repotted, and in a very short time they outgrew all signs of the attack. Advice is sometimes given to inquire to throw their plants away when badly infested, and buy clean bulbs, but I have never been able to see the advisability of this, because most probably the new ones would have to follow suit in less than a year if they received the same treatment. My advice to such would be, shake out the bulbs, wash and repot, keep warm, but do not plunge; be careful in watering until fresh roots are made. And above all, keep them clean. *W. Griffiths.*

— How often do we read short glowing accounts of well-grown collections of *Eucharis grandiflora* in the columns of the *Gardeners' Chronicle*, but very few practical hints as to how such success is attained. Various methods are adopted for the extermination of the mite, and they are more or less successful for a time, but owing to the mite penetrating into the bulb, insecticides recommended for their destruction fail to reach all of them. The following method I have proved to be very successful if attended to during the present month: Shake out and examine any that fail to perfect the leaves, or dwindle away as soon as they are produced. Cut off any remaining leaves and roots, and peel them as you would an Onion. Cut away the bulb till no signs of discoloration are left, and if cut almost to the centre, no harm will ensue—but on no account must the base of the

bulb be cut off, or new roots will not readily push. Any that are attacked very badly must be burned, and as the mite would eventually destroy the others, nothing would be lost if this method proved a failure, so that an attempt to renovate them by such drastic measures as hacking away the bulb with a knife has something to recommend it. The bulbs having been prepared in the foregoing manner, wash them in diluted Fir-tree oil, or preferably Lemon oil, and allow it to dry on by spreading them out on a shelf in the stove for a day or two. Afterwards crowd the bulbs into shallow boxes filled with clean, coarse silver sand, about half burying them, and elevate the box over the hot-water pipes in the stove, taking care the sand does not become dry. Here they must remain till one or two new leaves are made, and by that time there will be a mass of roots. Separate these as carefully as possible, and put as many bulbs as is convenient into thoroughly well-drained 6-inch pots. It will be convenient to keep the largest together. I have found them do well in about equal parts turfy loam, leaf-soil, coarse sand, and charcoal. Plunge the pots in a gentle hot-bed of dung and leaves made up in a pit heated with hot water, shade carefully from the sun, and by the end of August transfer them to the stove, but do not plunge them in strong bottom-heat. In the following spring most of the plants will be ready for a shift into larger pots, but avoid disturbing the roots, for the less the roots of *Encharis* are disturbed the better; always give water when they require it, but not before. Some plants are flowering with me now that underwent this treatment last year. *W. H. Sharpe, Highwood.*

**DAFFODILS GOING "BLIND."**—There is a notion that Daffodils when forced into flower will sometimes go "blind." I am opposed to this view and to so-

FIG. 25.—POTATO TRAY.

called blindness, and have repeatedly stated that if a bulb contained a flower at all, it would put it forth in some form or other, even should no roots be made. The bulb I now send for your inspection illustrates this fully. While in the final stages of the so-called "basal rot," and without emitting a single root, this poor-looking bulb has put forth the flower it contained, the germ of which was formed six or eight months ago. Had this bulb its complement of roots, a flower-stem 15 inches high would have resulted, instead of the weak stem and pug-nosed bloom before us, which is also deficient in colour. This shows that no matter what the treatment is or the condition of the bulb, the flower will come forth with the ensuing growth if the foundation of a flower exists; and those bulbs which produce no flowers never contained one. A year ago I found a bulb of a double Daffodil on a path, where it had lain fully exposed to the severe frosts of that time. It was a flowering bulb, and not only proved that it could endure 32° of frost without injury, but when the frost departed, pushed its flowers some 3 inches from the bulb, and produced foliage of much the same length. *J.*

**FARMERS AND FRUIT CULTURE.**—It is very evident that "W. P. R." and I set out to discuss this matter of fruit culture for farmers on very diverse lines. I could hardly read without a shudder his suggestions as to interposing with fruit trees, Celery culture. Just imagine the effect on trees already become gross, of root-pruning them by cutting Celery trenches near the roots to prune the roots, then putting in a heavy dressing of manure for the Celery! What would the newly-pruned roots be doing while the Celery was growing but be feeding grossly on the manure, and making growth worse than ever? Modern fruit culture, with the object of securing not only the best samples but

large supplies, must be on very different lines from that. My rows of promising fruit trees have been rendered worthless by the system of intercropping and wholesale destruction of surface-roots which "W. P. R." advocates. The best form of hardy fruit culture is found in individualising each kind, in planting young bush or pyramid trees closely for a few years, thus utilising all the space, then lifting and transplanting with care, so as to give to every tree needful space for the next ten or twelve years, the lifting constituting not only the most efficacious of root-pruning, but also preventative of deep rooting, of canker, and other evils; of keeping the surface free from other crops, forking it lightly, and top-dressing with manure during the fruiting season; that is the way to obtain the finest and most marketable crops. I shall be glad to learn of something better, but it must be on other than the Preston lines. *A. D.*

### AN IMPROVED POTATO-TRAY.

Those who have to plant many sprouted tubers of early varieties of Potatoes know how important it is not to knock off or bruise the one or two tender sprouts each tuber possesses. To obviate the doing so, single trays or the shallow boxes in which the tubers have been placed to form sprouts and some roots, have to be carried to the garden on hand-barrows and other contrivances, so as to ensure the tubers being transferred from the bed of leaf-mould into which they have thrust their roots with no more exposure to the air than is unavoidable. The tray consists of two tiers (fig. 25), that enable twice as many tubers to be removed at one time on a hand-barrow as would be possible with single trays or ordinary shallow boxes; and in this way it is found by Messrs. W. W. Johnson & Son, Potato growers, of Boston, that there is both a saving of time in the removal of the tubers to the garden or field, and a freedom from injury to the latter by using them.

### NURSERY NOTES.

#### MESSRS. SUTTON AND SONS' PRIMULAS AND CYCLAMENS.

The first-named form the great floral attraction of the glass-houses belonging to this great seed-producing and selling firm, its attractiveness mainly consisting in signs of progressiveness from the types of but yesterday, and the greater number of the shades of colour observable. We do not think that any greater size in bloom is to be noted in the plants taken as a whole, although it is undeniable that greater substance has been imparted to the flowers of whole strains of the plant, whilst in others there has been no advance, neither deterioration in this direction. The varieties are, without an exception, sports or seedling variations of *Primula sinensis* (*sinensis* of Lindley), found in the gorges of Y-Tchang and Hu-Pe by the Abbé Delavay. The wild plant bears but little resemblance to the *Primula sinensis fimbriata* of our gardens in its flowers, and is more slender in all its parts.

The leaf variations of *P. sinensis* var. *fimbriata* afford trade cultivators a fortunate and ready means of subdividing *Primulas* into classes apart from the varying colours of the flowers; thus we have the broad divisions of Fernand Palm leaf; and these again are subdivided into light and dark shades of green, and all sections into single and double-flowered. Buyers of *Primula* plants or seeds are thus enabled to get the particular variety or varieties which meet their fancy; and nurserymen to group their plants the better to exhibit their characteristics, and for purposes of comparison.

#### THE DOUBLE-FLOWERED VARIETIES.

Taking the double-flowered varieties first, we have one with pink flowers, marked in the list as Double Pink, a very free bloomer, and early too, which always comes true from seed—one, then, that may be regarded as having its characteristics "fixed," as gardeners express it. But these "fixed" creations of the florists are not to be depended upon for all time, there usually coming a time, sooner or

later, when the florists' trammels are cast aside, and a metamorphosis takes place for the better or the worse, and our variety refuses to be fixed any longer. The Double Pink possesses a palmate leaf. Another double flower is Reading Scarlet, or, more correctly, crimson; it is the counterpart of the first-named, excepting in colour, and possesses a fine large truss of bloom—a showy, telling variety. Carnation-flaked is a variety with flowers that open white, and become flaked with carmine and pink as they age; and the later the plants are got into flower, the more flaking, until, in some instances, it takes the form of a suffusion of pink over the entire flower excepting the eye, which in this, as in all, remains of an orange colour. Some double rose-coloured varieties were remarked, which were flaked, and these were under treatment, not being as yet considered quite fixed in their peculiarities.

The moss-curl variety *alba magnifica* comes true from seed, but is offered only in mixture, the type being at present fleeting, like the previously-named variety. It is a pretty strain. A moss-curl leaved variety, with lilac-coloured flowers, which deepen in tint as the season advances; has a good flower and habit. This variety is, we believe, sold as seed at present only in mixture with other varieties. There are very nice white and pink varieties, with moss-curl foliage. Double Carmine Improved is an excellent flower, of much brilliancy when seen under artificial light; the habit of the plant is good, and the foliage is of the Palm type. A double white of the Fern-leaf race is a most commendable variety, free, with rich green foliage.

A good type was noted in Double Crimson, whose trusses show well above the foliage, in this respect it being one of the best; in Double Heliotrope, a promising novelty as regards its shade of colour, and the blossoms are large and thick of substance, the stalk of good length, and foliage palmate. As a continuous bloomer, the old Double White variety of Messrs. Sutton's type is as good as any.

The so-called Double Blue, after all, not quite a blue, but it is quite near that colour—in perhaps as near as we may be able to get—formed an admirable group of colour of a very desirable shade, excellent for toning down, and rendering cool to the vision masses of glowing scarlet and yellow, such as one finds in spring in forced Dutch bulbs, Iodan Azaleas, Narcissus, &c. It has palmate foliage, and so far, it is the best of these shades of colour.

#### THE SINGLE-FLOWERED PRIMULAS

Are a more numerous tribe; they have longer engaged the attention of the florist, and are the type of which the double forms are merely sports which have occurred from time to time, and been "fixed." We have in Sutton's Blue (Fern-leaved) one month earlier in coming into bloom than the Palm-leaved variety of the same shade of colour as that, and particularly free in flowering. Roxy Queen is also a Fern-leaved variety, with a good habit, as free to flower as the last named, and constant as regards its characteristics. Reading Pink has capital foliage; the colour of the flowers is light pink, their size large, and the foliage palmate. Reading Scarlet is an early variety, brilliant-coloured when seen at a distance, reminding one rather of some blood-red Wallflower than a Primula; it is very free. A variety of a lavender tint having white margins to the petals was remarked. It is a flower that will find many admirers among the ladies. Reading Blue has much depth of colour, a stout stalk, and well-elevated truss of fine, large flowers—a wonderfully true stock, the plants and flowers showing no variations whatever. Brilliant Ruby, not to be confused with Ruby King, has a short flower-shaft, but its flowers are produced in two and three tiers as the plant acquires age. The stock was particularly true, and but a very small proportion showed pale-coloured blooms.

A distinct-looking Primula was remarked in the Fern-leaved White, whose truss and blossoms are of great excellence, pure white on opening, but becoming flaked with age. The foliage is of a dark tint of green. We should not omit mention of Snowdrift,

a profuse-flowering variety, whose lack of rigidity in the flower-stalks allows the flowers to fall about in a graceful manner, unlike those of any other *Primula sinensis*; it has Fern-like leaves, and flowers of the palest white.

#### THE GIANT VARIETIES.

In the so-called Giant varieties we have single-flowered forms with relatively enormous blossoms of colours resembling those we have already touched upon in this notice. Mention should be made of Giant Crimson, which has flowers of the identical colour of those of *Primula japonica*, which are of a very large size, becoming of a finer tint as they age; it has palmate leaves, and is a poor seeder, like so many others of much excellence. Giant White has likewise palmate leaves, very large flowers, borne well above the foliage, and a compact habit, which is due to the shortness of its leaf-stalks. There is a Fern-leaved Giant White, which is less well liked. Giant Crimson is a companion to Giant White, with palmate leaves and equally fine flowers and trusses, and the same substantiality in them. Giant White, with bronzy-green palmate foliage and leaf-stalks, and fine flowers with great substance in them was remarked. There are strong-growing forms with cerise-coloured flowers of differing shades, but seeds of these are not offered by Messrs. Sutton in separate packets, still they come as do several others in packets of mixed seed. An extra good strain is Giant Pink, a free and early bloomer, excellent for flowering at this part of the season, as well as later. It possesses palmate foliage. An equally good variety with the foregoing is Brilliant Rose, an old market type of Primula, the colour of the flowers improving as they age.

#### CYCLAMENS.

The selected varieties of *Cyclamen persicum*, grouped under the rather misleading name of *C. grandiflorum*, form at the present date quite a feature of the Reading establishment, vieing in floriferousness and colour-effects with the Chinese Primulas, and like those classified, in a minor degree, perhaps, by their differences of leaf-colouring, into marbled, zoned, Begonia, and green-leaved varieties. The marbling of grey on the leaves appears to be due to a partial detachment of the epidermis from the substance of the leaf, and is not constant, as it disappears to a greater or lesser degree as the leaf ages.

A variety with fine large flowers of a deep crimson colour is Vulcan, of which the firm possesses a larger batch of plants than in any previous year. This, like others, is a break from a white-flowered variety. The very large spreading flowers of Butterfly rivet the attention at once, by reason of their size, peculiar twisted shape, and pure whiteness. We doubt if a larger or finer white variety exists in Europe. Crimson and White, Giant Purple, and Rose Purple, were remarked, the last-named possessing a spreading habit of flowering that is very distinct, fitting the plants admirably for filling baskets or edging shelves in the greenhouse situated above the level of the eye. A so-called Salmon Queen is of a lovely shade of colour, borne well above the foliage; decided and distinct, and coming very true from seed. Of this type a variety exists with blooms of a deeper shade of pink, and also larger.

Cyclamens in other colours were remarked, whose excellent habit of growth, freedom to bloom, pleasing colours, and large flowers differed little from those we have mentioned. In one of the houses some plants of *C. repandum*, *C. Conm*, *C. ibericum*, and its variety *C. i. Atkinsii*, were remarked, pretty enough in their way, but, as garden plants, greatly inferior to the present race of *C. persicum*. Moreover, few of them are sufficiently hardy to withstand our winters, whereas the species *C. Neapolitanum* and *C. europæum* are hardy in the milder parts of Britain.

#### THE PROPAGATION OF THE DAHLIA AT MR. CHAS. TURNER'S.

On calling at the Royal Nursery, Slough, recently, I found that the propagation of the Dahlia by means of cuttings had already commenced. The house employed for the purpose is a low, lean-to,

35 feet in length, by 7 feet in width; and this is wholly devoted to the production of cuttings. A bed, 4 feet in width, occupies the front of the house, and being breast-high, is near the glass. In a hollow chamber below are the hot-water pipes; the bottom of the bed is formed of stout slates. On this is placed a bed of compost consisting of two-thirds good loam, and one-third of well-decayed manure and sand, and in this the store-roots, which were lifted from the open ground last autumn, are about half buried. Here they remain for about a fortnight, and they are then sprinkled overhead with warm water, sparingly at first; meanwhile, the tubers put out roots which soon begin to run freely in the soil. At the back of the house the width of the passage along it admits of two long narrow boxes being placed against the wall, one nearly breast high, the one above the other; these boxes are 9 inches deep and wide, have slate bottoms, and they are filled with compost; and here the pot-roots are placed of each varieties as are not represented by ground roots. The pot-roots are in lines of three or four from back to front; each sort is isolated from its neighbour, and correctly named. Two return pipes pass along the wall just beneath the boxes, and so supply the necessary bottom-heat. The house is thus planted entirely with Dahlia-roots for propagating purposes, leaving just room for the propagator to pass along.

Mr. Uphill, the propagator at Slough, stated that a good "ground" root will produce from forty to fifty cuttings, beyond which number it is undesirable to go, as the succeeding cuttings are weakly. A "pot" root gives about a dozen good cuttings. The number of roots planted for the production of cuttings depends upon the popularity of the variety and its productiveness. Some Dahlias are so attractive and so constant as to be in larger demand than others; of show varieties these are Mr. Gladstone and Maud Fellows, two charming light varieties; Glowworm, John Walker, Colonel, and R. T. Rawlings; of fancy varieties, Mrs. Saunders, Fanny Sturt, Duchess of Albany, Mrs. J. Downie, Rebecca, and Peacock.

Pompon varieties always sell well, as they are now greatly esteemed for cutting and border purposes. No single varieties are now grown at Slough; they as a section appear to be a vanishing race.

The first shoots arising from the roots are vigorous, stout but hollow; and they are rejected. The next and succeeding batches are more suitable, being solid and wiry; they are taken off just below the lowest joint, but not sufficiently low to injure the eyes round the base of the cuttings, from which other cuttings soon appear. Eight or nine of the cuttings are placed in a small 60-sized pot containing a fine sandy compost, which is pressed rather firmly about them, and the pots of cuttings are then placed in a frame where there is a gentle bottom-heat, but a rather dry atmosphere at the top. Not a great deal of heat is required to induce them to root; in January and part of February they will root in five weeks or so; later on, in three or four. When the cuttings have rooted, they are potted singly into large thumb-pots, returned to the warm frames, and as soon as the warm spring weather admits of it being done, the plants are taken to a cold frame, kept close for two or three days, and then gradually hardened off for sale. Previous to the preparation of orders, the plants require to be sorted into their several varieties, for readiness of selection when orders are made up. This is done on some mild early morning, the plants returned to the frame, sprinkled overhead, kept close, and shaded for a few hours, and then exposed to a free circulation of air. The dispatch of young growing plants commences at the end of April, and goes on through May. R. D.

CASSELL'S "HISTORY OF ENGLAND."—A people's edition of CASSELL'S *History of England from the Earliest Period to the Present Time* (CASSELL & Co., London, Paris, and Melbourne). is being issued at a low price in fifty-two weekly parts. It contains plentiful illustrations, and, as regards the letter-press, the name of the publishers is of itself a sufficient guarantee of its reliability and general excellence.

## SOME EASILY-GROWN ORCHIDS.

ALTHOUGH comparatively few proprietors of gardens, or professional gardeners, are in a position to enjoy the pleasures to be derived from possessing or cultivating a large collection of Orchids, still it is within the reach of many who do not attempt it, to grow a small collection of the more useful species and varieties. These will generally prove of easy cultivation in an ordinary stove and greenhouse, together with the ordinary inmates of such glasshouses. It is said that the mere word Orchid is a stumbling-block to many gardeners, and that those who can grow well such difficult plants as Dipladenias, Læcheanantias, and greenhouse Ericas, hesitate about undertaking to cultivate an Orchid. However this may be, I am sure that some of the more useful Orchids are of easy cultivation, and no intelligent gardener with the proper means at hand, need fail with them. Considering how cheap are many of the species, and how invaluable for decorative purposes, the blossoms of some of them lasting for weeks in good condition when separated from the plants, they should be grown by every one who is an admirer of beautiful and curious flowers.

Orchids, like some other plants, are more effective when each species is seen grouped together in some quantity, and this applies equally to the plants when in flower and to the flowers themselves when cut from the plants. Moreover, when several plants of a certain species are cultivated altogether, their cultural requirements are more readily met than is the case when the plants are mixed together. It is, therefore, prudent for those who necessarily have a limited collection, to grow those only which succeed under identical treatment—at least, so far as regards temperature, ventilation, and the amount of shading found needful.

At the top of my list I will place the *Calanthe*, viz., *C. Veitchii* and *C. vestita*, old favourites, which blossom during the winter, and whose graceful flower-spikes are invaluable for cutting, lasting several weeks in good condition. Many improved varieties have been raised of late years, and I myself have raised, amongst others, a very pretty white form of *C. vestita* from seed. *Cologne cristata* is another well-known favourite, of which there are several varieties, all of which are good. This is remarkably free in flowering, easily increased by division, and it is, without doubt, one of the most prized of Orchids. A variety named *C. c. maxima* is valuable on account of flowering later than the type. There is also the *Chatsworth* variety, which is likewise a late bloomer.

*Cypripedium insigne* is another plant long introduced into our gardens, whose flowers appear freely during the winter season, and last a long time in good condition. This is a plant the value of which is sometimes underrated because it is old. There are many beautiful forms of it, some of them quite recently introduced; but their cultivation presents no difficulties. *Cypripedium Leeanum*, *C. L. superbum*, and *C. Spicerianum*, are all of them free winter-flowering varieties, and, like the foregoing, easily cultivated, and the blossoms particularly suitable for cutting. *C. caucanthum* and *C. c. superbum* are also free in flowering and good doers, but their flowering season is during the summer.

*Cattleya Bowringiana*, although I cultivate but a few plants of it, is in every way so satisfactory, that I do not hesitate in classing it amongst the useful, easily-cultivated species; also *Thunia Marshalliana*, which is one of the best of this beautiful genus, flowering freely in June, very easily cultivated and increased.

*Dendrobium nobile* is so old an inhabitant of our gardens that there is no need for me to sing its praises. There are several varieties, all of which are as free-flowering as the old form. Its season of flowering may be much prolonged by introducing rested plants at intervals into a house with good warmth. *D. Phalænopsis Schroderianum* is a grand acquisition very beautiful and free-flowering, and owing to the length of its flower-spikes, it is much

appreciated for cutting purposes. My experience with it is more limited than with the others named.

Many equally good Orchids might be mentioned—as, for instance, *Cattleya Mossia*, *Lælia anceps*, *Lycate Skinneri*, *Odontoglossum Alexandræ*, &c. I omit cultural details because they are always seasonably given in the Orchid Calendars of this journal. *T. Coomber*, *The Hendre*, *Monmouth*.

## NOTICES OF BOOKS.

TEN NEW ENGLAND BLOSSOMS. By Clarence Moores Weed. (Boston and New York: Houghton, Mifflin & Co., Riverside Press, Cambridge.)

Ten plants are here treated of by the author, who considers the subject of the inter-relation of plants and insects. The Willow (*Salix discolor*), Trillium, Orchis, Polygala, Lily, and Thistle are among the types selected, their diverse methods of pollination and fertilisation being clearly explained. Use is, of course, made of the researches of Sprengel, Darwin, Asa Gray, and other botanists, whose works prove invaluable to the writers of less original books. In the case before us, the author has personally tested many of the experiments detailed, and the result of these and of the study of the works of reference consulted is clearly set forth. *Ten New England Blossoms* is a handy and an elegant book, which we recommend both to those who desire to learn a few of the main facts already discovered as to the relations between insects and plants; and to those who, purposing afterwards to go more deeply into so important a study, are desirous of an elementary text-book to aid them when beginning. The illustrations are not all new, but are all sufficiently good and clear, and many particularly so. The whole book is both a change from, and an advance upon, many others of its class, being up-to-date both in spirit and matter. The difference between botany of the past and of the present is recognised, and that the mere collection of specimens and inspection of their outward characteristics is no longer considered sufficient; "the botanist of to-day is as likely to collect his specimens in a pill-box or on the point of a needle as in a vasculum. His collecting fields are as likely to be the test-tubes of the laboratory, the aquaria of the class-room, or the benches of the conservatory, as the outdoor world. Instead of being a recluse, he himself is likely to be a man among men, actively interested in the world's affairs. Botany to him, rather than a sequel of murder, is often a witness of new births, and his ancient prototype's chronicle of the dead becomes with him a chronicle of life."

OUR EDIBLE TOADSTOOLS AND MUSHROOMS, AND HOW TO DISTINGUISH THEM. By W. Hamilton Gibson, with thirty coloured plates, and fifty-seven other illustrations by the author. (New York: Harper & Brothers.)

The full title of this beautiful book indicates that it contains a selection of thirty native food-varieties, easily recognisable by their marked individualities, with simple rules for the identification of poisonous species. As most of the species mentioned are "native" also to Britain, we need offer no excuse for calling the attention of our readers to this elegant and useful volume. The author discusses at great length the characteristics by which the edible species may be distinguished from the poisonous ones, and rightly disregards as untrustworthy or worthless all the popular tests. The only safety consists in an accurate botanical knowledge of the species. The acquisition of this knowledge must necessarily always be a slow process, and not always possible of attainment. The author therefore submits certain "rules for the venturesome." These rules may be thus summarised:—Avoid every Mushroom having a "volva" cup at the base. This excludes the highly dangerous species of the *Amanita* section.

2. Exclude those having an unpleasant odour or taste, or a tough consistence. This latter criterion would cause the exclusion of the *Champignon*.

3. Exclude those infested with worms, or which are in a state of decay or age.

Allowing the correctness of the author's diagnosis of the *Amanita*, he would do well to add to his rules this one:—Take care not to eat fungi unless you have seen a perfect specimen, for it might well happen that a specimen might be gathered leaving the cup in the ground, so that that test would not be always available. Should the experimenter unfortunately partake of *Amanita*, the effects of which do not show themselves—according to the author—before eight to twelve hours after eating it, the treatment recommended is the hypodermic injection of atropin, in doses of one-sixtieth of a grain, repeated every half-hour till one-twentieth of a grain has been given. This sounds very like setting a thief to catch a thief, and in any case is a procedure which should be left to the duly-qualified medical man. The cases cited are, indeed, very interesting from a medical point of view, though they are not such as usually find place in a popular treatise.

After having eliminated the poisonous *Amanitas*, the author goes on to describe and figure several of the better-known edible species, such as *Agaricus campestris*, *arvensis*, *procera*, *Morramia oreades*, *Coprinus Lentarius*, *Fietulina hepatica*, and others.

The coloured illustrations are, for the most part, excellent and characteristic, that of the beef-steak fungus, we should say, least so; but these plants are so variable, that the American forms may be very different from our own. The woodcuts deserve high commendation for their beauty and accuracy.

Of *Polyporus sulphureus*, we are told that it possesses marked luminous properties. These are so marked, that on one occasion Hawthorne is recorded to have made use of this "fox-fire" as a flambeau which lighted his path for several miles through the otherwise impassable woods. Other chapters are devoted to the making of spore-fruits, and to the publication of receipts for cooking the toothsome morsels.

The author fully acknowledges his obligations to his predecessors and contemporaries (we think, by the way, that Dr. Cooke would disdain being called "Rev.") and has produced a really delightful volume. Printer and publisher have also done their work well.

BRITISH FUNGUS FLORA. By George Massee; vol. iv. (George Bell & Sons.)

Mr. Massee's work progresses steadily. This fourth volume, which is cast in the same mould as the others, is devoted to the *Ascomycæ*. A general account of the conformation of the plants of this group is given, followed by some useful hints on collecting, and on preparing the plants for useful comparative study. The illustrative figures are useful in spite of their being sometimes small and crowded. Good drawings to a uniform scale are the more valuable as evidence, inasmuch as "type specimens" such as are made use of as vouchers by workers in other groups of plants are often non-existent, and still more often they could not be satisfactorily preserved.

## SOCIETY.

## READING HORTICULTURAL.

The Thirty-ninth annual meeting of the Reading Horticultural Society was held at the Abbey Hall recently. The Mayor (Mr. Owen Ridley) presided; and there were also present Messrs. F. J. Ferguson, J. T. Strange, R. Webb (Beenham), G. W. Webb, J. Woolford, T. Neve, T. Bowie, C. Burton, and W. L. Walker (secretary).

The secretary read the annual report and balance-sheet which were as follows:—

It is with satisfaction your committee present the Thirty-ninth report and balance-sheet, which, although showing a reduction in balance carried forward, compares very favourably with the preceding year, £80 additional being awarded in prizes, while the reduction in balance is £30. The bulb show held in March was extremely disappointing, the receipts being under £35 against an expenditure of £140. The summer show proved satisfactory in every way, the attendance being larger, competition keener, and entries more numerous than at any exhibition of late years, showing the efforts

of the committee to popularise the shows are thoroughly appreciated. With regard to the coming season, it is not thought advisable to have a spring show, but the National Rose Society will hold its annual provincial exhibition in connection with our society on June 24 next.

ENQUIRY.

"He that questioneth much shall learn much."—BAOON.

JAPANESE BAMBOOS.—Can you assist me to the botanical equivalents of the following Japanese names for Bamboos:—Taisan-chiku, Kanzan-chiku, Koku-chiku, Hotei-chiku, Kikko-chiku, Shiho-chiku, Kinmei-chiku, Moso-chiku or Mosodake, Madake, and Ya-dake? R. O. [Mr. Mitford obligingly answers as follows:—]

Taisan chiku is a tropical Bamboo acclimatised in a stunted form in Japan; not hardy in this country. Probably=Bambusa vulgaris.

Kanzan-chiku = Arundinaria Hindsii, Munro, Bambusa erecta, Hort., Marlic, &c.

Koku-chiku, a new name to me, I cannot, therefore, identify it.

Hotei-chiku, also new to me. Can it be a mistake for Hōrai-chiku=Phyllostachys aurea?

Kikko-chiku = Bambusa heterocycla, described by Mr. Bean in Gardeners' Chronicle, 1894, and by myself in the Garden, 1895.

Shiho-chiku = Bambusa quadrangularis. Kinmei-chiku = B. castillonis, Hort.

Moso chiku, Moso-dake = Phyllostachys mitis. Madake, I believe = Bambusa or Phyllostachys sulphurea, but am not certain.

Ya-dake.—The Japanese make this a synonym of Phyllostachys bambusoides; but the Japanese nursery gardeners, when asked for Yadaké or P. bambusoides, invariably send what has proved to be nothing but Métaké—mutato nomine. Yadaké signifies the Arrow Bamboo, which would imply a tough, fairly solid stem, fit for arrows, which P. bambusoides does possess, and Métaké does not. I may add that I cannot find either Koku-chiku or Hotei-chiku in such Japanese authorities as I have. Shiho-chiku is = B. quadrangularis, Shiho-chiku = B. marliacea; so your correspondent must be careful as to the one letter.

THE WEATHER.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Table with columns for DISTRICTS, TEMPERATURE (Above 42° or below 42° the Mean for the week ending February 1, 1896), ACCUMULATED (Above 42° for the Week, Below 42° for the Week, etc.), RAINFALL (No. of Rainy Days since Dec. 29, 1895, Total Fall since Jan. 1, 1896, etc.), and BRIGHT SUN (Percentage of possible Duration for the Week, etc.).

The districts indicated by number in the first column are the following—

- 0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S. Channel Islands.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending February 1, is furnished from the Meteorological Office:—

The weather was fine and dry over the kingdom generally until the latter part of the period, when the conditions became dull and gloomy. Local fogs and mists, however, prevailed at times in different parts of the country, while in the extreme north and north-west rain was not infrequent.

The temperature was above the mean in all districts, the excess ranging from 1° over the east, south, and south-west of England, to as much as 4° to 5° in Scotland. The highest of the maxima were recorded during the early days of the week, when they ranged from 56° in 'Scotland, E.,' 'England, S.W.,' and 'Ireland, S.,' to 49° in 'England, E.' The lowest of the minima occurred during the latter half of the period, and ranged from 24° in 'England, S.W.,' and 25° in 'England, S. and N.E.,' to 33° in 'Scotland, W.,' 34° in the 'Channel Islands,' and 35° in 'England, N.W.'

The rainfall was a little in excess of the mean in 'Scotland, N.,' but deficient in all other districts; over England the fall was very slight.

The bright sunshine was less than the normal in 'Ireland, S.,' and 'Scotland, N.,' and just equalled it in 'Scotland, W.,' and 'Ireland, N.,' in all other districts, however, there was an excess, that in the north-eastern parts of Great Britain being large. The percentage of the possible duration ranged from 41 in the 'Channel Islands' and 40 in 'England, N.E.,' to 33 in 'Scotland, N.,' 11 in 'England, N.W.,' and 9 in 'Scotland, N.'

MARKETS.

COVENT GARDEN, FEBRUARY 6.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table listing plants in pots with average wholesale prices. Columns include plant name, quantity, and price.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table listing cut flowers with average wholesale prices. Columns include flower name, quantity, and price.

ORCHID-BLOOM IN VARIETY.

Table listing orchid bloom in variety with average wholesale prices. Columns include variety name, quantity, and price.

OLD POTATOS.

Market quiet, with no movement in prices since last report.

NEW POTATOS.

Supplies during the past week have not been quite so heavy. Prices, as per last report, are firm. J. B. Thomas.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table listing fruit with average wholesale prices. Columns include fruit name, quantity, and price.

SEEDS.

LONDON: Feb. 5.—Messrs. John Shaw & Sons, Seed Merchants, of Great Mark Pond, Borough, London, S.E., report to-day's market thinly attended, with only a small inquiry for Clover and grass seeds; meantime, supplies all round continue abundant, and prices moderate. Full rates are asked for Canadian Alsike. White Clover seed is slightly easier. For spring Tares there is an improved sale. Winter Vetches are inquired for. In Rape seed the tendency continues upward. There is this week no change in Mustard. The new Wisconsin Green Peas, being cheap, handsome, and excellent boilers, are much appreciated. For Haricot Beans the sale is slow. Bird seeds show no fresh feature.

FRUITS AND VEGETABLES.

BOROUGH: Feb. 4.—Quotations:—Savoys, 3s. 6d. to 5s. per tally; Onions, 2s. 9d. to 3s. 6d. per bag; Carrots, 2s. to 2s. 6d. per dozen bunches; Turnips, 1s. 9d. to 2s. do.; Sprouts, 9d. to 1s. 3d. per half-sieve; Apples, 4s. to 6s. per bushel.

SPITALFIELDS, Feb. 4.—Quotations:—Savoys, 2s. to 3s. per tally; Curly Kale, 9d. to 1s. per bushel; Seakale, 10d. to 1s. per bundle; Brussels Sprouts, 1s. to 1s. 3d. per half-bushel; 2s. to 2s. 6d. per bushel; Beet-root, 1s. to 1s. 3d. do.; Carrots, 22s. to 25s. per ton; Turnips, 25s. to 30s. do.; Onions, 3s. to 4s. per cwt.; Rhubarb, 1s. to 1s. 3d. per dozen bundles; Parsnips, 5d. to 7d. per score; Bunch Greens, 1s. 3d. to 1s. 6d. per dozen bunches; Parsley, 1s. 6d. to 2s. do.; Celery, 12s. to 15s. per dozen rounds; Apples, dessert, 4s. 6d. to 5s. 6d. per bushel; do., cooking, 3s. 6d. to 5s. do.

STRATFORD: Feb. 4.—The open weather continues to cause a drag in the Potato and root trade. Vegetables are in plentiful supply, therefore at rather low rates. Celery is short, and in fair demand. Quotations:—Collards, 1s. to 2s. per tally; Savoys, 1s. 6d. to 4s. do.; Greens, 9d. to 1s. per bag; do., 1s. to 1s. 3d. per dozen bunches; Cauliflowers, 1s. 3d. to 1s. 6d. per dozen; do., 5s. to 7s. 6d. per tally; Scotch Kale, 3d. to 6d. per sieve; Beetroot, 4d. to 6d. per dozen; Brussels Sprouts, 1s. to 1s. 3d. per half-sieve; Rhubarb, forced, 1s. to 1s. 3d. per dozen bunches; Celery, 8s. to 12s. do.; White Turnips, 1s. 6d. to 2s. per bag; Horseradish, 1s. 3d. to 1s. 3d. per bundle; Parsley, 1s. to 1s. 3d. per dozen bunches; Carrots (household), 24s. to 30s. per ton; do., cattle feeding, 20s. to 24s.; Parsnips, 4d. to 6d. per score; Mangels, 11s. to 15s. per ton; Swedes, 12s. to 16s. do.; Onions, English, 4s. 6d. to 5s. per cwt.; do., Dutch, 3s. to 3s. 3d. per bag; do., Bordeaux port, 5s. to 5s. 6d. per case; Apples, English cookers, 2s. 6d. to 4s. 6d. per bushel; do., dessert, 2s. 6d. to 4s. do.

FARRINGTON: Feb. 6.—Quotations:—Savoys, 4s. per tally; bunch Greens, 1s. 6d. per dozen; Sprouts, 1s. 3d. per half-bushel; Turnips, 2s. per dozen bunches; Carrots, 2s. do.; Celery, 1s. 3d. per bundle; Leeks, 1s. 6d. per dozen; Rhubarb, 1s. per dozen bunches; Parsnips, 2s. per bag; Artichokes, 1s. 6d. per half-bushel; Horse-radish, 1s. 2d. per bundle; Curly Kale, 1s. per bushel; Seakale, 1s. per packet; Apples, Greenings, 15s. per barrel; Baldwins, 18s. do.; Pearmain, 20s. do.; Northern Spy, 18s. do.; Newtown Pippins, 16s. do.; Russets, 20s. do.; Tomatos, 2s. 6d. per tray; Grapes, 1s. 6d. per pound.

ANTS: L. Place carbolic acid about the house, and in their haunts and runs.

BOOKS: A Subscriber, Ancrley. The Illustrations of the British Flora, by W. H. Fitch and W. G. Smith; published by L. Reeve & Co., Henrietta Street, Covent Garden, W.C. This should be used in conjunction with Bentham & Hooker's Handbook of the British Flora. Alpine Plants, by A. W. Bennett, M.A., and illustrations by J. Sebth; published by Swan, Sonnenschein & Co., Paternoster Square.—P. B. A. Stove and Greenhouse Plants, by T. Baines. It is published by John Murray, Albemarle Street, Piccadilly.

CAMELLIA LEAVES BROWNED ON THE UPPER SURFACE: G. W. The appearance indicates over-fumigation or sulphuring.

CLEODYNE CRISTATA, DISFIGURED PSEUDO-BULBS: W. K. The discoloration is caused by insect punctures in the first instance, then fungi follow, G. M.

**CORRECTION.**—Under the heading, 'Highgate Chrysanthemum Society,' in our issue of February 1, p. 142, for Mr. J. W. Kerahan read J. McKerchar.

**CUCUMBERS DESTROYED:** *Puzzled.* Eelworms at the roots. Clear out soil and plants, disinfect, white-wash, and wash out the pit and start anew with soil from some other source, and if possible plants from some distant garden. Char everything taken out of the Cucumber-bed.

**CYCLAMEN:** *W. W.* Fasciated flowers of Cyclamen are by no means uncommon. In your case, the appearance is due to the union of two flower-stalks.

**DENDROBIUM DALHOUSIANUM:** *J. Talmage.* Growth of the dimensions you give denote extraordinary vigour, and much beyond the average in number also.

**GARDENERS' ROYAL BENEVOLENT:** *Sans Peur.* We have sent your letter to the secretary.

**HYNIDS:** *J. A.* The name of the female parent should come first, with the sign ♀, followed by a ×; and then the name of the male parent, ♂. But this rule, like the code of nomenclature, is as much honoured in the breach as in the observance.

**MUSHROOMS:** *Constant Reader.* We are sorry we cannot tell you the cause. We should procure spores from another source, although there is no blame to be attributed to the dealer.

**NAMES OF PLANTS:** *J. S.* 1, *Chimonanthus præcox*; 2, *Arbutus Unedo*.—*P. W.* *Mormodes buccinator*, one of the most variable in colour of any Orchid. —*A. J. N.* *Cypripedium × polystigmaticum* (*Spicerianum × venustum*).—*M. D.* 1, may be a seedling *Passiflora*; 2, *Carex variegata*; 3, *Panicum gramineus*; 4, *Coccoloba platyclada*.—*M. C.* Please send again when in flower.—*S. P. D.* 1, *Davallia bullata*; 2, *Adiantum macrophyllum*; 3, *Adiantum gracillimum*; 4, *Adiantum Williamsii*; 5, *Pteris serrulata cristata*; 6, *Pteris critica cristata*; 7, *Pteris serrulata*.—*J. M., Chelmsford.* *Cypripedium villosum*.—*J. G.* 1, *Amaryllis reticulata*; 2, *Cypripedium igneum*; 3, *Frittonia argyrea*; 4, *Anthericum lineare variegatum*; 5, may be *Gardenia florida*; 6, *Eucharis species*; 7, send in flower, none of the things sent is a fair specimen; 8, *Plumbago capensis*, if a blue flower.—*R. C.* A very pretty, but not extraordinary variety of *Dendrobium nobile*.—*D. T.* 1, *Begonia hydrocotylifolia*; 2, *Salvia fulgens*.

**NEWLY DUG-UP CLAY SUBSOIL:** *Margaret.* Not poisonous to plants, but infertile; that is, it is deficient in plant-food. When pulverised by frost, wind, and rain, and mixed with the staple, grass will grow on it, and not readily get browned in hot weather.

**SIX VARIETIES OF MARKET ROSES, H.P.'S, AS DWARFS:** *Roses.* Flesh-coloured, Captain Christy; pink do., La France; Rose do., Paul Neyron; dark crimson do., Fisher Holmes and A. K. Williams; light crimson do., Etienne Levet.

**VINE BORDER, 4 FEET WIDE AND 3 FEET HIGH:** *A New Subscriber.*—You should not plant any deep-rooting plant; in fact, it would be better if the border were kept for the Vine roots only. A line of *Saxifraga muscoides*, *Sedum Ewersii*, or the annual *Mesembryanthemum crystallinum* (Ice plant), *Portulacca*, or the like.

**VINES:** *A New Subscriber.* Let the roots alone for this season; that is, until you have ascertained the kind of fruit and growth the Vines will produce. You might ascertain if the drainage is in order, then write again.

**VINE WASH:** *A New Subscriber.* Get some soft-soap, and put 4 oz. into a gallon of hot water—say, at 130°; and after having removed the loose bark, wash the rods, using a stiff brush, and being careful of the buds. Having done this, give them a dressing of Gieharst-soap, at the rate of 2½ to 3 oz. to the gallon of water, thoroughly dissolving it. Very hot water alone will remove and kill scale.

**COMMUNICATIONS RECEIVED.**—W. J. Rolover, late for publication.—A. C. F.—*Nottingham Guardian*.—J. Wells.—P. B.—T. B.—H. C. Geneva.—U. D. Berlin.—J. C.—W. W.—M. D.—*Giornale di Agricoltura*.—H. # MESSRS. BELL'S BOTANICAL BOOKS.

## JOHNSON'S GARDENERS' DICTIONARY.

New Edition, thoroughly Revised and Considerably Enlarged by  
**C. H. WRIGHT, F.R.M.S., & D. DEWAR,**  
*Curator of the Glasgow Botanic Gardens.*  
Complete in One Volume, Demy 8vo, cloth, 9s. nett.

NOTE.—The First Edition of this work was published in 1846, and at once became recognized as the standard authority on the subject, a position which it has retained ever since. It has passed through numerous editions, but has not been completely revised since 1843, though Supplements have twice been added since that date. For this edition the whole book has been carefully revised from beginning to end, with considerable additions, and has in all respects been brought up to the present state of Horticultural knowledge.

"It is without doubt one of the most reliable and important Gardening Dictionaries that has ever been published; in fact, as a dictionary and guide for gardeners, amateur or professional, its equal is not to be found in Horticultural literature. When the eight parts are completed, it will form a marvellous digest of matters horticultural, and a standard work for the guidance of all interested in the art and science of gardening."  
*—Horticultural Times.*

## SOWERBY'S ENGLISH BOTANY.

Containing a Description and Life-size Drawing of every British Plant. Edited and brought up to the present standard of Scientific Knowledge by T. BOSWELL (late SYME), LL.D., F.L.S., &c. *Third Edition entirely revised.* With Descriptions of all the species by the Editor, assisted by N. K. BROWN, Twelve Vols. with 1937 Coloured Plates. £24 3s. in cloth; £27 15s. in half-morocco; £31 13s. in whole morocco. Also in 89 Parts, 5s. except Part 88, containing an Index to the whole Work, 7s. 6d.  
SUPPLEMENTARY VOLUME. To be completed in 8 or 9 Parts. Parts I.—III. by N. E. BROWN, of the Royal Herbarium, Kew, forming Vol. XIII. of the complete work. Cloth, 17s.; or the Parts separately, 5s. each.

## FUNGUS-FLORA,

A Classified Text-book of Mycology. By GEORGE MASSEE, Author of *The Plant World*. With numerous Illustrations. The most complete work on the Fungi. 4 vols. Post 8vo, 7s. 6d. each.

## THE BOTANIST'S POCKET-BOOK,

Containing, in a tabulated form, the Chief Characteristics of British Plants, with the Botanical Names, Soil or Situation, Colour, Growth, and Time of Flowering of every Plant, arranged under its own Order, with a Copious Index. By W. R. HAYWARD. Seventh Edition. Fcap. 8vo, Cloth Limp, 4s. 6d.

## PLUES' RAMBLES IN SEARCH OF WILD FLOWERS.

By MARGARET PLUES. With Coloured Plates. 4th Edition. Crown 8vo, 7s. 6d.

## LONDON CATALOGUE OF BRITISH PLANTS.

*Ninth Edition.* Demy 8vo, 6d.

## ROBSON'S BOTANICAL LABELS,

For Herbaria. Demy 8vo, 5s.

Sole Makers:—WM. THOMSON and SONS, LTD., Tweed Vineyard, Clovenfords, N.B.

Price Lists and Testimonials on application.  
Analysis sent with orders of ½-cwt. and upwards.  
SOLD BY ALL SEEDSMEN.

## BENTLEY'S Prize Medal INSECTICIDE.

USED BY THE LEADING GARDENERS.  
1 pint, 2s.; 1 quart, 3s. 6d.; ½ gallon, 5s.; 1 gallon, 9s. 3 gallons, 24s.

JOSEPH BENTLEY,  
CHEMICAL WORKS, BARROW-ON-HUMBER, HULL.

## LETHORION (Vapour Cone) PATENT.

The total destruction of Insect Pests in Greenhouses is thoroughly secured without the slightest possible injury to Flowers or Plants of the tenderest kind. IT CANNOT fail where the houses are secure. Red Spider, Scale, and Mealy Bug can be easily eradicated by doubling the Cone power.

PRICES: For frames, &c., of 50 to 100 ft., 6d.; 500 to 700 ft., 9d.; 1000 to 1500 ft., 1s.; 4000 ft., 3s. 6d.

The public are cautioned against imitations in various forms at less cost, as they have in most instances proved to be worthless articles, totally unequal to Lethorion in strength and effect.

MANUFACTURERS— F.F.S. & I.

## GORRY & CO., LTD., LONDON.

To be obtained from all Seedsmen and Florists.

## EPPS'S A1 PEAT

(SELECTED specially for ORCHIDS),

531 to 537	Unglazed Lights, 6 ft. by 3 feet 8 1/2 in.; stiles, 2 in. by 2 in. ... 4 0

### GARDEN HAND FRAMES.

These Frames will be found to be very useful for protecting plants, seeds, slips, and cuttings, during the spring, which, if left uncovered, would probably fall victims to the extreme cold so prevalent in this country during that season.

Zinc open tops, with glass cut to sizes and zinc clips for glazing same.

LOT.	Usual Price.

### "INVINCIBLE"

### HOT-WATER APPARATUS.

MOST EFFICIENT AND CHEAPEST IN EXISTENCE.

Lot 538 to 552.

Requires no sunk-stoke-hole and no brick setting. Will last all night without attention. Will burn house cinders; therefore costs next to nothing for fuel. Anyone can fix it. A child can stoke it. Success guaranteed. No. 1 Boilers only, capable of heating 75 ft. 4-inch piping.

Usual price 55s.

Estimates for Complete Apparatus Free on Application.

### SPAN-ROOF POULTRY HOUSES.

Made in sections, complete, with door inside and window at end, a flap at back for access to nest boxes, a raised floor about 2 feet from ground, so as to form a dry run underneath; nest, perch, ladder, &c.; painted one coat outside.

If set across three Columns the lowest charge will be 30s.  
Page, 2s; Half Page, 2s 10s.; Column, 2s.

**GARDENERS AND OTHERS WANTING SITUATIONS.**  
26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.  
Births, Deaths, and Marriages, 5s. each insertion.

**POSITION.**—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

**NOTICE TO ADVERTISERS.**—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.  
Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

**POSTAL ORDERS.**—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to H. A. STRATTON, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON STREET, STRAND, W.C.

**SUBSCRIPTIONS.**

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, Great Queen Street, London, W.C., to H. A. STRATTON.

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

**TO FLORISTS.**—Re-engagement wanted by a young Lady. Several years' experience. Good taste in Making-up. Highest references.—**H. F.**, 41, Wellington Street, Strand, W.C.

**£10,000 A YEAR.**—How one might play the part of Prince Bountiful on such an income! What comfort and relief one could bring to the poor and to the suffering. And yet, even without money, one can do good if one has the will. If I see a fellow-creature suffering from ague, fevers, or disorders of the stomach; or from gout, rheumatism, neuralgia, and the like, I don't need to be a man of wealth in order to show him the way to health. If I point out to him the wonderful efficacy of **HOLLOWAY'S PILLS and OINTMENT**, I have perchance done more good by that one thoughtful action, than I could have achieved with all the wealth of all the Rothschilds.

BY SPECIAL APPOINTMENT TO H.R.H. THE PRINCE OF WALES.

# MACKENZIE & MONCUR, LIMITED, HOTHOUSE BUILDERS & HEATING ENGINEERS.

**Friday Next, February 21.**

By order of Mr. P. McArthur, The London Nurseries, Maida Vale, W.

A magnificent importation of

**CATTLEYA PERCIVALIANA AUTUMNALIS** (new).

Quite distinct from the ordinary type. My collector writes:—"Found on a mountain at an altitude of 2,500 feet, and has never been introduced into Europe before. This is the scarcest of all Cattleyas in Venezuela, and the most difficult to get. I had to cut my way through woods that were almost inaccessible. This collection is the richest in colour I have ever found, and cannot be too strongly recommended."

Also some extra good plants of

**CATTLEYA ELDOBRADO SPLENDENS,**

And a grand lot of

**ONCIDIUM PAPILO MAJUS,**

richly spotted variety. Some

**NEW CATASETUMS and ANGILOA RUCKERII.**

**MESSRS. PROTHEROE AND MORRIS** will sell the above by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, February 21, at half-past 12 o'clock.

On view morning of Sale, and Catalogues had.

**Thursday Next.**

By order of Messrs. LINDEN, Brussels

A MOST IMPORTANT SALE

of the

**OLD CATTLEYA LABIATA,**

Synonym CATTLEYA VAROQUEANA.

A grand new importation, in very fine order, having been collected in the same district from whence Messrs. Linden first re-discovered and re-introduced their unrivalled and unapproachable type of this famous Cattleya.

Many remarkable distinct masses are included in this consignment, which promise to surpass those wonderful forms already known and distinguished.

Linden's type of Cattleya labiata is universally acknowledged and proclaimed to be the finest and grandest of this most magnificent and kingly of all Cattleyas.

The plants are in magnificent order and condition.

**MR. J. C. STEVENS** will sell the above by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY NEXT, February 20, at half-past 12 o'clock precisely.

On view morning of Sale, and Catalogues had.

**Monday, February 24.**

**A SPECIAL SALE OF FIRST-CLASS PERENNIALS.**

Many scarce varieties being offered, consisting of Aquilegias, Dictamnus, Poppies, Campanulas, Helianthus, Primulas, Hepaticas, Tritomas, Gaillardias,

CARNATIONS, PICOTEES, PINKS, EXHIBITION HOLLY-HOCKS, DELPHINIUMS, PHLOXES, PYRETHRUMS,

PÆONIES, Double and Single Pansies, &c.

A Grand Collection of IRIS, GERMANICA, KEMPFERII, and other varieties; hundreds of GLADIOLUS, Brechenleyensis, Gandavensis, Lemoinei, and Bimous sections.

ANEMONES, TIGRIDIAS, and MONTBRETIAS, BEGONIAS, Double and Single, from an unrivalled Collection.

DAHLIAS (pot-roots), consisting of Cactus, Singles, and Pompons; CLEMATIS and Hardy Climbers; Tea and other ROSES. Also, Importations from the Caucasus and the Western States, and a quantity of HOME-GROWN LILIES, comprising all the finest varieties.

**MR. J. C. STEVENS** will sell the above by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on MONDAY, February 24, at half-past 12 o'clock precisely.

On view morning of Sale, and Catalogues had.

To Market Gardeners, Florists, &c.

**MR. G. P. A. ROBINSON** will sell by PUBLIC AUCTION, at the Western Hotel, Penzance, on SATURDAY, February 22, inst., at 4 o'clock in the afternoon, all that LEASEHOLD TENEMENT known as RED HILL COTTAGE, in the parish of Madron, Cornwall, comprising an excellent Dwelling-house, Stable, and 3 acres of Garden Land, held for the residue of a term of 99 years, determinable on two lives, aged respectively 38 and 34 years, subject to the yearly rent of £3 7s. 6d. Together with three Policies of Assurance on the above lives for amounts making together £400, at moderate premiums.

Four Forcing-houses are erected on the land, of the following lengths—100 feet, 85 feet, 60 feet, and 25 feet, all fitted with Heating Apparatus of the most approved description, and in complete working order.

The land is in a high state of cultivation, is thoroughly stocked with fruit trees and plants which have been selected from the best varieties, and is well supplied with water.

The property is distant about 1 mile from the town of Penzance, and is situated in a sheltered valley.

Further particulars may be obtained of the Auctioneer, Causeway Head, Penzance; or at the offices of Messrs. TRYTHALL and BODILLY, Solicitors, Penzance.

Dated February 11, 1895.

### ORCHIDS AT KEW.\*

THE collection of Orchids cultivated at Kew is essentially different from any, at least in this country, in the possession of a private collector, and perhaps its only rival is that of the Royal Botanic Gardens, Glasnevin. Its main object is botanical, and to represent the family Orchidee in as comprehensive a way as possible. The scientific interest attaching to Orchids is very great. But even as regards form, they can only be studied from dried specimens with great difficulty; and as regards their varied and remarkable structural arrangements, and the striking mechanical contrivances for cross-fertilisation which they exhibit, they cannot be studied in the dried state at all. While the Kew collection contains representatives of all the most beautiful and popular species, it is more especially rich in others which at first sight are not particularly attractive. Most of these, however, on careful examination will be found to possess no small degree of charm and interest.

In 1880, Dr. Pfitzer, Professor of Botany in the University of Heidelberg, came to Kew to study in the Jodrell Laboratory the Kew collection of Orchids for his well-known researches on their morphology, and he has continued to draw on it since for further aid.

Dried herbarium specimens of Orchids are not easily procurable. Species frequently flower at Kew of which no other material exists available for study. By this means the Herbarium of the Royal Gardens has been continuously enriched. And in this respect it is also under great obligations to Glasnevin, the Right Honourable Joseph Chamberlain, Sir Trevor Lawrence, and others.

The task of exhibiting a collection of Orchids to the public is not an easy one. The dimensions of the houses which are suitable to their cultivation, and the conditions which it requires, are such as to preclude the admission of visitors. This is, however, of the less consequence, as, when out of flower, their general aspect for the most part is not, except perhaps to the expert, either instructive or interesting. The two public Orchid-houses at Kew, Nos. 13 (warm) and 14 (cool), contain for the most part only the plants which happen to be in flower at any particular period. These houses are not suited to the permanent cultivation of the bulk of the collections which at other times is carried on in the Orchid-pits (No. 15), to which the public is not admitted.

The cultivation of Orchids is one of the most remarkable developments of modern horticulture. Kew has neither the means nor the accommodation to compete with the magnificent displays of certain species to be seen in the gardens of many private growers. The President

\* We take these interesting statements from the *Hand-list of Orchids Cultivated at Kew*, just published, and to which we shall refer more fully later on.

of the Royal Horticultural Society in 1885 complained, in his opening address to the Orchid Conference held in that year, that "there is no sufficiently representative collection of Orchids there (at Kew) at present." It is hoped that the present *Hand-list*, which enumerates 200 genera and 1800 species (including about fifty garden hybrids), will remove that reproach as far, at any rate, as its representative character is concerned. And it is only right to say that, in arriving at this result, Kew is under great obligations to the liberality of Sir Trevor Lawrence, the Keeper of the Royal Botanic Gardens, Glasnevin, and various private growers and commercial firms, especially amongst the latter, Messrs. F. Sander & Co. of St. Albans. The bulk of the collection has, however, been built up by direct importation and purchase.

Orchids have been continuously cultivated at Kew from their earliest introduction into this country. The varied fortunes which have attended the collection practically reflect the history of the progress which has been made in the art of growing Orchids under artificial conditions.

The first exotic Orchid which was introduced into English gardens was *Bletia verecunda*, which was obtained from Providence Island, Bahamas, by Peter Collinson, in 1731, and flowered in the following year in the garden of Mr. Wager. About the year 1778 *Phaius grandifolius* was imported from China by Dr. Fothergill, and a full-sized coloured figure of it is given in the first edition of the *Hortus Kewensis*, under the name of *Limodorum Tankervillei*. A peculiar interest attaches to this plant, because it was in it and at Kew that in 1802 Francis Bauer, who was "resident draughtsman for fifty years to the Royal Botanic Garden," discovered and figured the "nucleus of the cell," an all-important body, the first description of which was published by Robert Brown in 1833.

In the first edition of Aiton's *Hortus Kewensis* fifteen non-British species are enumerated as cultivated at Kew, Sir J. E. Smith wrote:—"We have scarcely seen any one species of this genus (*Epidendrum*), except in a dry state, before the year 1787, when *E. cochlearatum* flowered at Kew; nor was it till October, 1782, that *E. fragrans*, of Swartz, exhibited its rich and elegant bloom in the same rich collection. At present, several species are to be seen flowering in the spring and autumn."

In the second edition of the *Hortus Kewensis* (1813) 115 species are enumerated, of which eighty-four are exotics belonging to thirty-nine genera, "the greater number," John Smith states in his *Records of Kew* (p. 228) "being epiphytal and natives of the West Indies, a few of the East Indies, Cape of Good Hope, and New South Wales."

According to the same writer, Dr. Roxburgh sent a number of species from India in the early part of the present century. "These," writes John Smith, "I found growing in 1822, on a shelf above a fine against the back wall in what was then called the propagation-house; the *Aërides* growing and flowering freely, its roots clinging to the back wall, as also *Saccolabium guttatum*. There were also plants of *Dendrobium Pierardi* and *D. cucullatum* flowering freely, which had recently been brought home from Calcutta by Mr. Pierard." But it was to Roxburgh that English gardens owed, beside the first *Aërides*, the first *Dendrobium*, and the first *Vanda*.

These "back walls" are only seldom found in modern horticultural structures; but they were not without their merits.

At this period, with the exceptions above-mentioned, the Orchids at Kew "were potted in common soil, and the pots plunged to the rim in a tan-bed." It is not surprising that their cultivation was attended with little success.

A little earlier than this the first step was taken in the direction of modern treatment. Sir Joseph Banks devised and carried out at Isleworth a method which was "one of the most successful modes of

treating epiphytal Orchids then known." Mr. H. J. Veitch, F.L.S., in his excellent historical account of "Orchid Culture, Past and Present" (*Journal of the Royal Horticultural Society*, 1889, xi., pp. 115-126), remarks:—"This was the first rude forerunner of our modern Orchid-basket, and the first instance I find recorded of moss being used for surfacing" (p. 118).

According to John Smith (*Records*, pp. 229, 230):—"Between the years 1823 and 1825 a considerable number of species were received from Trinidad, forwarded by Mr. David Lockhart, the Superintendent of the garden, amongst which were the first plants of *Stanhopea insignis*, *Oncidium papilio*, *Lockhartia elegans*, *Catacætum tridentatum*, *Ionopsis pallidiflora*, and others, all of which were epiphytal, and many of them being sent growing on portions of branches as cut from the trees, which being accompanied by instructions from Mr. Lockhart as to how they should be treated, led to the successful cultivation of epiphytal Orchids."

A whole generation was, however, to pass away before the culture of Orchids was placed on an intelligent footing. Dr. Lindley, during the middle part of the present century, dominated the horticultural world. In 1830 he read a paper before the Royal Horticultural Society, in which, generalising from insufficient data, he concluded "that high temperature, deep shade, and excessive humidity, are the conditions essential to the well-being of the plants" (Veitch, *l. c.*, p. 119). Thirteen years later he was substantially followed by Mr. Bateman, "except the important direction, to give the plants a season of rest" (*l. c.*, p. 120).

The cultural treatment approved by Lindley, "became, as it were, the only orthodox one, and was generally persisted in, in all its essential points, for upwards of thirty years."

Two men, however, broke away from the current tradition, and with conspicuous success. "One of the first of these was Joseph Cooper, gardener to Earl Fitzwilliam, at Wentworth" (1835). "A still bolder innovation was adopted shortly afterwards, by Paxton, at Chatsworth." In both cases the essential innovations were lower temperature and increased ventilation. The old tradition still, however, held its ground:—"Plants perished under the barbarous treatment they received in the hot-houses of this country almost as fast as they were imported. To such an extent were the losses felt, that Lindley, in a remarkable article published in the *Gardeners' Chronicle* towards the end of 1859, pronounced their treatment 'a deplorable failure,' and which Mr. Bateman also, some years later, characterised as 'incredible folly'" (Veitch, *l. c.*, p. 123).

(To be continued.)

## NEW OR NOTEWORTHY PLANTS.

### ODONTOGLOSSUM CRISPUM ASHWORTHIANUM (New Var.).

To flower a variety of *Odontoglossum crispum* with some brown or purple blotches on its segments used to be considered a happy circumstance, and if the blotches were there, the indifferent form of the flower was often excused; but to possess one in which the flowers were of the finest form, of the largest size, and in which they might be said to be almost entirely of various shades of rose and clear rosy-purple, perhaps never entered the mind of the most enthusiastic lover of this fine species. And yet, that is precisely what has taken place in this latest and finest of new *Odontoglossums*, which has recently bloomed in the rich collection of Elijah Ashworth, Esq., at Harefield Hall, Wilmslow, Cheshire (gr., Mr. Holbrook), who kindly sends flowers and material from which this description and the accompanying illustration (fig. 26, p. 197) was prepared.

As has been intimated, almost the whole of the flower is of a bright rosy-purple, shading off to light rose as it approaches the silvery-white margin. The base of each of the sepals and petals is white, and on their surfaces a few white marks appear. The base

of the lip is yellow, and on each side of the callus are some irregular bright yellow lines; the blade being ornamented by dark reddish-purple blotches. The exterior of the column is purple, and its face yellow. The reverse of the flower is wholly of a rich purple hue. It is difficult to imagine a more perfect or beautifully-coloured flower in its class—certainly none such has yet appeared. In form it is nearest to the superb *O. c. apiatum*, in colour its nearest approach is *O. c. Frantz Masereel*, but that is a long way behind in every respect. It flowered out of an importation by Messrs. F. Sander & Co., and after passing through other hands is by that firm introduced to its present home, James O'Brien.

## THE GREAT FROST OF 1895 AT KEW.

(Continued from p. 170.)

BULBS, &c.—The spring of 1895 will long be remembered as a particularly fatal one to many kinds of bulbs. All the Narcissi of the Tazetta section were killed, and even some of the trumpet Daffodils suffered a good deal; maxims, for instance, was quite killed, and this beautiful form fared no better in a large bulb-growing establishment in the neighbourhood. When taking up the ripened Narcissus bulbs, it was noticed that their quality was below the average; this was, doubtless, due to the fact that the roots first developed were all killed, and new ones had to be formed where the bulbs were not actually destroyed.

Hyacinths suffered badly, the white and red varieties more than the blue ones. Those in nursery beds, planted early in the previous September, were quite destroyed, whilst older bulbs planted under similar conditions six weeks or two months later survived. Hitherto, winter covering for Hyacinth-beds had not been found to be of advantage at Kew; but in such winters as that of 1894-95, it is necessary. The wild type, *Hyacinthus orientalis*, was nearly all killed in the border.

IRIS.

Many of the *Oncoclytus* group were killed, the rhizomes proving to be quite rotten when examined after the frost had gone. The "English" Iris did not stand so well as the "Spanish" Iris; of the former, about 75 per cent. were killed. Of the English Iris, the survivors were so weak that they were not worth the trouble of lifting for replanting. *Iris reticulata* stood without any shelter, and flowered freely; some of the bulbs dug up after they had ripened off were dried up, whilst others were perfectly sound. Many species of *Crocus* were killed outright; others were badly injured. *Crocus sativus*, for example, managed to exist on the food stored up in the corms themselves; all the roots had been killed, and in some cases the lower portion of the corms. *Gladiolus Colvillei*, and its variety *alba*, planted in the open ground in January as in previous years, were killed.

HERRACROUS PLANTS.

Lack of space renders it impossible to give a detailed statement of the losses incurred, but a few comparisons may well be mentioned. *Meconopsis Wallichiana* (a fine lot of plants in pots in a cold frame) was killed under glass, whilst a couple of unprotected plants in the rockery survived and flowered. The Pampas Grass, *Gynerium argenteum*, was killed in the rockery, whilst on the open lawns in many places the plants, although much injured, survived and flowered. The same remarks apply to the New Zealand *Arundo conspicua*. Even some of our native plants did not withstand the severities of the winter as well as many from countries in more southern latitudes with a warmer climate than Britain. Our native Thyme, *Thymus Serpyllum*, was much cut, and did not break again from the bare branches until late in the season. *Dryas octopetala* behaved in a similar way. The Cape of Good Hope *Berkheya radula* was killed outright, whilst *B. purpurea*, under exactly similar conditions, came through the ordeal unscathed. The collection of *Primulas* in pots in a cold frame withstood the

winter successfully (better than they did that of 1893-4); there were very few deaths, and these were perhaps not due to cold. On the other hand, a considerable number of alpine and dwarf herbaceous plants, grown in pots in cold frames for exhibition when in flower in the alpine-house, succumbed. *Kuiphofia*, even where well sheltered with dry leaves, suffered a good deal in some spots; in others, they were untouched. *Fluggea japonica*, large breadth of young plants being grown on for forming a turf in shady places where grass does not thrive, was all killed; whilst old masses which had not been transplanted, were but slightly injured. Many of the Cacti grown in a cold frame in the herbaceous ground were killed; amongst these may be mentioned *Opuntia brachyarthra*, *O. aurantiaca*, *O. imbricata*, *Echinocactus Wiedliszenii*, *Cereus cirrhiferus*, &c.

CONIFERS.

*Pinus insignis*, which usually suffers every winter at Kew, was scarcely affected by the frost of February. *P. tuberculata* and *P. muricata* were

sent us measured exactly 4 inches across the lateral petals, while the labellum, which is proportionately large, was beautifully fringed. The ground colour is a rich clear yellow, spotted with very dark chestnut, the even distribution of these spots and their bright colour being very noticeable. Major Pigott informs us he bought the plant in the imported state at Messrs. Protheroe & Morris' for *O. crispum*, and he is to be congratulated on having flowered such a splendid variety, which is decidedly superior to the best forms of *O. Wilckeanum*.

"It is interesting too, as illustrating the great variety of species and forms found in the home of *O. crispum*."

VANDA SPATHULATA (*Sprengel Systema*, iii., 719; Lindley, *Folia Orchidaceae* (Vanda), p. 9, n. 21).

A native drawing of this handsome golden-yellow species, together with the information that living plants of it have been got over from Ceylon, through Messrs. P. W. Woolley & Co., Basinghall Street, seems to promise that it will again receive a trial in gardens, and if the plants are really

A COLLECTING TOUR IN JAMAICA.

(Continued from p. 135.)

THE scenery up the winding Rio Grande is magnificent. Where the land is not cultivated, immense Silk-cotton, wild Fig, Cedar, Mahoe, Trumpet (*Cecropia peltata*), and other trees, from which depend festoons of Cocoon (*Entada scandens*) and *Ipomoea*, grow down to the edge of the water, whilst the canoes and rafts with natives on the river add to the picturesqueness of the scene.

Leaving this beautiful place we proceeded on our journey, and soon arrived at Port Antonio, a very pretty town of considerable importance, being the centre of the fruit trade. Steamers carrying fruit run regularly between Port Antonio and various ports in the United States. The port is divided by a narrow peninsula into two harbours, in one of which steamers of large size can lie close up to the wharves and receive or unload their cargoes. The Boston Fruit Company, by far the largest growers of Bananas and Cocoa-nuts, run their own steamers and, although they have competitors, they practically control the fruit market.

The majority of the large Banana plantations were once flourishing Sugar estates, but had to be abandoned owing to the unfair competition of the bountified European Beet-sugar industry. We left Port Antonio and pushed on for Priestman's River, a distance of 11 miles or so, our road taking us through Mangrove swamps, Cocoa-nut plantations, and grazing pens, along the wild rocky coast. The trunks of Mahogany, Sea-side Grape (*Coccoloba uvifera*), Calabash, Silk-cotton, and other trees, were covered by immense clumps of *Brassavola cordata* and *Broughtonia sanguinea*, especially the former, which we noticed in splendid condition in several places growing in the forks of trees overhanging the sea, and washed by the spray of waves dashed against the rocks. The Bread-fruit tree (*Artocarpus incisa*), here becomes a very common feature near negro settlements, and the trees were loaded with their large fruits, which are eaten either roasted or boiled, and by many are preferred to Yam. It certainly is a most excellent and nutritious culinary fruit. Mangoes, Star-apples, Avocado Pear, and other fruit trees were plentiful. During this stage of our journey we experienced a thorough tropical storm. The peals of thunder and roar of the surf combined were deafening; the lightning was so vivid that after each flash our animals stood still, both they and we being deprived of vision for a moment or two, and the rain came down in torrents. We were soaked, and feared that our specimens which had been gathered with such care would be ruined. As it turned out, many were spoiled, and others lost their colours through having to remain in the wet papers all night. Our halting-place lay some distance inland; we were strangers in the district, and entirely ignorant of the geography of the locality. The night was pitch dark, and we were at a loss to know what to do, when fortune smiled on us once more, and placed a guide in our way, who, for a consideration, undertook to lead us to our destination. Never were we more thankful to get under the shelter of a hospitable roof.

After going over the extensive property of our host, an English gentleman who, with his family, has recently settled down here, we began to explore the district, and made a good collection of various coast plants. On rocks near the sea, and often washed by the spray of the sea, we found *Adiantum deltoideum* growing in abundance, *Jacquinia armillaris*, the Cob-nut (*Omphalea triandra*) in flower and fruit, *Morinda citrifolia*, *Hymenocallis caribaea* growing plentifully along the sea-shore, and flowering freely, are a few of the plants gathered here. *Brassavola cordata* and *Broughtonia sanguinea* grow on the trees everywhere in this district. After a stay of a few days here, we proceeded on our journey to Bath, passing through Manchioneal. In a large Cocoa-nut plantation near this village, we noticed a very curious Cocoa-nut Palm, on the trunk of which the old flower-stems remained attached from near the

FIG. 26. - ODONTOGLOSSUM CRISPUM ASHWORTHIANUM: FLOWERS ROSEY PURPLE, MARGINED WITH WHITE. (SEE P. 196.)

somewhat injured, but will soon recover. *Pinus rigida* lost most of its leaves, but has since completely renewed them. Two plants out of three of *Podocarpus chilina*, which have stood out at Kew for the last twenty years, were quite killed; the third has grown again from the buried part of the stem. The Cyresses which have quite succumbed are *C. torulosa* and *C. glauca*; *C. sempervirens* and *C. macrocarpa* have been badly injured. The Golden Retinosporas have lost many small branches, whilst the ones with green, silvery, or glaucous foliage remain untouched. *Kew Bulletin*, January.

(To be continued.)

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUM LYROGLOSSUM (*Major Pigott's var.*).

MESSRS. SANDER have forwarded us the following note: "We have received a bloom from Major J. C. M. Pigott, The Verne, Instow, Devon, of *Odontoglossum lyroglossum*, which we consider so fine and so distinct as to be well worthy the varietal name given above. It is certainly one of, if not the finest form we have ever seen, the colours being particularly good and the markings very regular and well defined. The flower

strong and healthy, possibly with better results than heretofore. The beauty of the rich yellow flowers, each of which is about 2 inches across, is well-known; but hitherto it has the reputation of being shy-flowering, a term which in this case, as in many more, may be intended to mean that its habits and requirements up to the present have not been sufficiently grasped to get the wealth of floral beauty which it displays in its native land. Fresh trials may reveal the cause of former failure.

ODONTOGLOSSUMS FROM ARDDRARROCH.

The *Odontoglossums* in the collection of R. Brooman-White, Esq., at Garelochhead, seem to thrive in a remarkable manner in the genial air of the locality, and their flower to assume the best qualities possible to attain. A small sending gives samples of some of the fine varieties now in flower under the care of Mr. G. Roberts, the gardener at Arddaroch. The first is the finest form of *O. x* excellens we have yet seen, the flower being very large, of a rich canary yellow, with white bases to the petals, and large chestnut-brown blotches over all the segments; the sepals and petals are similar, oval in form, and just on 1 inch in width; the base of the lip is rich orange. *O. x Wilckeanum splendens*, and a fine form of *O. x Coradii* are also exceptionally good and distinct.

have all the way up the stem, giving it a singular appearance. The tree was as tall as its neighbour, about 40 feet high. We were unable to detect any difference in the leaves of this and neighbouring trees, although closer examination might reveal differences, but we could easily see that its fruits were very much smaller than the ordinary Cocoa-nut, and we were informed that they contain little or no "milk" or "jelly." The proprietor of the plantation has promised to procure specimens of this interesting tree for careful examination. It may be mentioned here that, although Cocoa-nuts are so extensively grown in Jamaica for export, little or no use is made of the husks, which produce coir, used for manufacturing matting, brushes ropes, &c. They are allowed to lie in heaps under the trees to rot.

We next passed through the Hector's River district, where there are good grazing-pastures, with fine flocks of sheep, and numbers of brood mares, generally of a small size. A remarkable thing about some of the pastures along the north-eastern coast is that, one field will be over-run with Guava bushes (*Psidium guajava*), whilst perhaps the next field to this is infested with the wild Hop-bush (*Flemingia strobilifera*). Neither plant is of any value for feeding purposes, and both are a great nuisance to the landowners, as once they get a good hold of the land it is impossible, without incurring heavy expense, to eradicate them.

We were very much surprised to find no Guinea-grass here, as we were under the impression that it was ubiquitous from sea-level to 4500 feet altitude. We were aware that above 4,500 feet it ceased to grow spontaneously, but we did not expect to find miles of country without it. Guinea-grass seeds were accidentally introduced from the West Coast of Africa as bird food in 1745. It appears that a Mr. John Ellis imported some birds from the coast of Guinea, and with them seeds for food. The birds died soon after, and the seeds were thrown away as useless. The Grass-seed germinated, and the Grass grew luxuriantly, and it was noticed that cattle ate it greedily. It was then transplanted into a garden and cultivated, and it soon became thoroughly established. *W. Harris.*

(To be continued.)

## FRUIT PRESERVING IN THE CRIMEA.

The British Consul at Odessa, reporting to the Foreign Office on the agricultural condition of the district, draws attention to fruit preserving as quite a new industry in the Crimea. In the very short time it has existed, he says, it has increased so rapidly that it seems probable that it will not only do away entirely with the imported article, but will itself become an article of export. With the exception of Oranges and Lemons, the Crimea produces every sort of fruit required, and is capable of producing any quantity for which there may be a demand. As early as 1840 attempts were made by the Government to introduce this industry, but until the railway was opened in 1874, connecting the Crimea with the rest of Russia, the cost of transport prevented fruit preserved in the Crimea from competing favourably with that imported, whilst it was out of the question to export fresh fruit for eating, so that fruit cultivation was little thought of. As soon as the railway was completed, Moscow merchants bought up large quantities of fruit which they sent to Moscow, partly for eating, and partly for preserving, but the difficulty of sending some of the more perishable sorts of fruit, led them to try preserving on the spot, and the attempt was such a success, that hardly any fresh fruit, except that for consumption as such, is now sent away. The first trial was made in 1877 at Simferopol by a well-known Russian firm. For three years the fruit was preserved by them without special machinery, but in 1880 the business had grown so much, that the firm sent to France for a skilled manager, by whose advice steam apparatus for boiling, drying &c., was

put up. In 1879 another well-known Moscow firm set up a factory at Simferopol, also under foreign superintendence; and in 1881 another factory was established, more especially for the so-called Paré of Tomatos, which has now become a Crimean specialty; since then several smaller factories have been started at Kertch, Simferopol, and other places, which every year increase their output. At first the price of fruit was very low, but it soon rose, and although large gardens and orchards are continually being laid out, the demand increases as fast as the supply, so that the price is maintained, and there are gardens where £200 to £250 is paid for the Apricot crop alone. The fruit is sold on the trees before it ripens; as soon as the amount can be estimated, so that the purchaser takes all risks. Competition is not felt by the factories, as the demand is equal to the supply, and both grow continually.

The factories turn out bottled and tinned fruits, fruits in syrup, crystallized fruits, (glacé) jams, jellies, and *puré*, which is a sort of stewed fruit, the fruits used being Apricots, Peaches, Pears, Apples, Quinces, Figs, Plums, Cherries, Sweet and Water Melons, Walnuts, Tomatos, Oranges and Lemons, the Oranges and Lemons being the only imported fruit, all the rest being grown in the Crimea.

The quantities of fruit bought up by the three principal factories alone were in 1894:—

Crimean fruit	...	500 tons of the value of	£3,700
Tomatos	...	1,000	1,400
Imported fruit	...	100	4,600
Total	1,000		£14,100

Each year about 10,000 tons of fresh fruit, valued at £140,000, are sent to the north of Russia for eating.

From the above, it will be seen that the cultivation of fruit has now attained very large proportions in the Crimea, and particularly noticeable is the quantity of Tomatos taken up by the factories. Until the factories were started, the Tomato was but very little grown, as it would not stand transport, and the local demand was small; but now it is largely cultivated, as a most profitable crop.

The produce of the factories, especially the crystallized fruits, compare very favourably with those prepared in France. Last year (1895) the fruit-harvest was a total failure, and enough fruit could not be got in the Crimea, so that quantities had to be imported from Bessarabia.

## NATURAL HYBRID ORCHIDS.

(Continued from p. 103.)

The next allusion I find to the occurrence of a natural hybrid among tropical Orchids is in 1859. Reichenbach then described *Lælia irrorata*, from the collection of Consul Schiller, of Hamburg (*Hamb. Gartenz.*, xv., p. 57), and after pointing out its affinity with *Lælia Schilleriana*, and some resemblances to *Cattleya intermedia*, we find the additional remark, "Bastard?" which shows that the author suspected it to be of hybrid origin. A year later the same author described *Lælia eupatha*, from materials sent by Dr. Casper, of Berlin, and M. Lüdemann, of Paris, on which occasion he observed, "I doubt not that this *Lælia* is a Bastard" (*Hamb. Gartenz.*, xvi., p. 420). He then went on to remark, that the pollinia much resembled those of *Lælia elegans*, except in number—being four only, yet still united to each end of the caudicle—and that the plant might be a hybrid between *Lælia Boothiana* and *purpurata* and *Cattleya intermedia*, or some allied species. With respect to these plants having appeared accidentally, he observed that they could not have been collected in flower, but that probably some old trees on which various forms grew together had been stripped, and the plants brought home for our collections.

These remarks are interesting, as they show that the observations made in Europe were not lost upon Reichenbach, who was evidently beginning to grasp the significance of similar phenomena among tropical Orchids. It is now clear that both *Lælia irrorata* and *eupatha* are natural hybrids between *L. pur-*

*purata* and *Cattleya intermedia*, and also that they are forms of *Lælia* × *Schilleriana*, Rehb. f., a plant described in 1835 from Consul Schiller's collection at Hamburg (*Allg. Gartenz.*, xxiii., p. 322), whose hybrid origin was not even then suspected, for long afterwards it was still enumerated as a species. We shall have to return to this point presently.

The author's remarks on the pollinia of *Lælia elegans* are also suggestive, though he evidently at that time did not realise the significance of the facts observed. This was a plant which was originally discovered by Devos, a collector for the late M. Ambroas Verschaffelt of Ghent, in the island of Santa Catharina in 1847, and which flowered for the first time in Europe in the following year, when it was described by Professor C. Morren as *Cattleya elegans* (*Ann. de Gand.*, iv., p. 93, t. 185). In 1852 it was again figured (*Bot. Mag.*, t. 4700), from a plant which flowered with Messrs. Backhouse of York, out of an importation of *Lælia purpurata*, from the same island. Sir William Hooker identified it with Morren's plant, though at the same time expressed doubts as to its distinctness from *Cattleya superba*. Shortly afterwards Lindley also obtained a flower from the collection of Mrs. Lawrence, of Ealing, when he pointed out that the pollen-masses were eight in number, but that four were very small, and lodged in shallow pockets in front of the anther; finally remarking—"This, too, is a *Lælia*, if the mere number of pollen-masses shall definitively separate the two genera—*Cattleya* and *Lælia*" (*Gard. Chron.*, 1853, p. 582). Reichenbach formally transferred the plant to *Lælia* in 1853 (*Allg. Gartenz.*, xxiii., p. 242).

It has long been recognised that this plant is a natural hybrid between *Lælia purpurata* and *Cattleya Leopoldi*, and it is a significant fact that both the parents were also sent home by Devos, though at a somewhat later date. *Lælia purpurata* was originally figured and described under the name of *Cattleya Brysiana* (*Lem. Gard. Fleur.*, iii., tt. 275, 276), from a plant which flowered in M. Verschaffelt's establishment in May, 1851, which had been received in the previous year, and it is believed that *Cattleya Leopoldi* came at the same time. How long it was before the hybrid origin of this plant was suspected is uncertain. Reichenbach makes no mention of it when describing *Cattleya* × *exoniensis*, the first of the series of *Lælia* × *Cattleyas*, which flowered with Messrs. Veitch in 1863 (*Gard. Chron.*, 1867, p. 1144). A second one, however, flowered the same year, and the records about it throw a curious light on the question. This plant was first exhibited at a meeting of the Royal Horticultural Society on September 22, 1863, under the name of *Cattleya* × *Devonia* (*Proc. Roy. Hort. Soc.*, iii., p. 372), and afterwards, on October 11, 1864, as *C. devoniensis*, on the latter occasion receiving a First-class Certificate (*l.c.*, iv., p. 178). This was claimed by Dominay, as a hybrid between *Lælia crispata* and *Cattleya granulosa*, the former being the seed-parent. No technical description appeared beyond the notes cited above, and the reason appears in a letter dated October, 1863, preserved with a specimen at Kew. It sets forth that the flower of *Cattleya* × *devoniensis* approaches so closely to some forms of *Lælia* × *elegans* that it had generally been looked upon as a form of that, and nothing more, and consequently the former name had been allowed to drop out of use. Mr. Soden, however, had pointed out characters that could only have come from *L. crispata*, and the question was whether the two hybrids were not really distinct, or, in other words, whether the hybrid origin of *Lælia* × *elegans* had been experimentally proved, as at first supposed. I believe not. On comparison of all the forms in question, it appears certain that *Lælia crispata*, and not *L. purpurata*, was one of the parents of *L. devoniensis*, while the *Cattleya* parent was in all probability *C. Leopoldi*, which at that period was confused with both *C. granulosa* and *C. guttata*. It may be further remarked that at this period the forms of *Lælia* × *Schilleriana* were not distinguished from *L. elegans*, which would increase the difficulty of separating *L. devoniensis*. Reichenbach cer-

tainly recognised the distinctness of the latter, for in 1877, when describing *Lælia* × *Sedeni* (a hybrid between it and *Cattleya superba*), he observed:—"The *Cattleya davoniensis* is a very curious product, since it is very much like *Lælia elegans*. I would even regard it the same, if it was not said to descend from *Lælia crispata* and *Cattleya guttata*, when there is, at least, to our actual knowledge, at the natal place of *Lælia elegans*, no *Lælia crispata* to be seen, and no *Cattleya guttata*, but the next cousins, *Lælia purpurata* and *Cattleya guttata* Leopoldi. It is much to be wished that Mr. Sedeni may soon raise magnificent hybrids by crossing the two last plants, the more so as within my knowledge the demand for *Lælia elegans* is far greater than can be supplied by the English growers" (*Gard. Chron.*, 1877, ii., p. 424). It is, therefore, evident that Reichenbach recognised the difference between these two plants, which have since, unfortunately, been confused together. We still await artificially-raised plants of *L. × elegans*.

Two years after Reichenbach described *Lælia irrorata* as a doubtful natural hybrid—namely, in 1861—another example appeared, from Guatemala. This was *Cattleya* × *guatemalensis*, T. Moore (*Fl. Mag.*, t. 61), a plant for which Messrs. Veitch, of the Royal Exotic Nursery, Chelsea, received a First-class Certificate in March of that year. It was sent home by Mr. G. Urs Skinner, who found it "growing in company with *Cattleya Skinneri* and *Epidendrum aurantiacum* on the stem of the same tree, from which circumstance," Mr. Moore remarked, "and from the singular flush of orange-colour which runs through the whole flower, the opinion has been hazarded that it may be a wild or natural hybrid between those two species." This record is interesting, and there can be no doubt about the hybrid origin of the plant. Skinner appears to have communicated with Lindley respecting this plant, for the herbarium of the latter contains a very interesting group, comprising flowers of *Cattleya Skinneri*, *Barkeria Skinneri*, and a third unnamed plant (labelled "hybrid?") with the remark, "'All from the same stock,' Guatemala, Skinner." This presumably represents Mr. Skinner's view of the origin of the unnamed one—which is *Cattleya* × *guatemalensis*—but Lindley has added in pencil "*Ep. aurantiacum* is ♀ and not *B. Skin.*" (Of course, which was the "♀" is purely conjectural.) So far as I can ascertain, Lindley never published anything about this plant, and unfortunately, there is no means of fixing the date. A few other individuals have since appeared among imputations of the parent species. *R. A. Rolfe*,

(To be continued.)

## FRUIT REGISTER.

### NEW PERPETUAL STRAWBERRY, LOUIS GAUTHIER.

AN apparently fine and valuable new Strawberry, under the above-mentioned name, which was originally described by M. André in the *Paris Revue Horticole* for September 16, 1895, is now being sent out by the well-known French fruit nurserymen, Messrs. Letellier et fils, of Caen, who are also the introducers of the new spineless Gooseberries raised by M. E. Lefort, of Meaux. M. André sums up the distinctive characteristics of this new Strawberry under four heads:—1, its extraordinary vigour of growth; 2, its enormous production of fruit, as many as 160 fruits having been counted on a single plant; 3, its white or blush-white colour, so rare amongst large-sized Strawberries; and 4, its considerable size, which exceeds that of the well-known variety, Dr. Morère. This new Strawberry was raised by Mr. L. Gauthier, gardener at the Château de Greuthéville, in Calvados, after whom M. André has named it. Its first crop ripens about the last week in June, and five of the finest berries were then found to weigh 570 grammes, or about 19 oz. The runners are produced early in the season, and quickly come to maturity, producing,

under favourable circumstances, a second crop of fruit about the month of September, which, if not quite so large in size as the fruits produced in June, are of equally fine flavour, and should prove most acceptable at that period of the year. Messrs. Letellier assert that this is absolutely the first large-sized Strawberry from which two distinct crops can be gathered in the same year. A well-executed woodcut, showing the appearance of the plant when in full fruit in June, and bearing its second crop in September, is sent to purchasers by Messrs. Letellier. *W. E. Gumbleton*.

## ENVILLE.

THE seat of the Countess of Stamford and Warrington, in Staffordshire, by reason of its somewhat inaccessible position, is seen by fewer gardeners from a distance than many a place of less pretensions. A distance of nearly seven miles intervening between the mansion and the nearest railway station, however, is sufficient to deter many a one from visiting—even a garden that has been as fine as any the country possessed. Nor need this fact reflect upon the enthusiasm of those who have been forced to forego such a pleasure as a visit would afford, though they have been in the vicinity of Stourbridge, for we are well aware that time in such a case is quite as essential as enthusiasm.

As the horse was not taken from the vehicle during the time we were there, justice may not be done in this article to the magnificent gardens; still, perhaps a note or two upon Enville as the place is seen now, since the extraordinary and princely features it had forty years ago have been modified, may not be without interest to some who saw the place under these conditions, as well as to those who may never have seen it at all.

Anyone should visit Enville who admires a large old-fashioned garden, where acres are as important as to the London suburban resident square yards have become, where the grounds include an abundance of green lawns and flower-beds, with many an admirable specimen of the best of our ornamental trees and Conifers, and where the whole place is surrounded by a park, and beautiful and picturesque environs extending for some miles.

It is a coincidence that this place, lying deep in the country, presents several features that remind one of a garden common a quarter of a century ago. The establishment is thoroughly well managed, and is by no means old-fashioned in everything, yet there are one or two instances where the visitor realises that the constantly changing fashions in regard to horticulture have affected Enville in less degree than most gardens. The large quantity of Pelargoniums, Ageratums, and other "bedding plants," as they are termed, in masses for creating breadths of colour effective from a distance, on beds raised above the ground level as much as 2 feet, remind one more of a flower garden earlier in the century than now. On the other hand, there are long borders where there is a good and varied collection of interesting herbaceous perennials, through their entire length. In speaking of the flower garden, it must be understood that this is one of the features that has been modified since the days when Enville was so famed for these.

In spite of this, however, the quantity that remains is quite sufficient to surprise many a gardener whose experience has been gathered during the latter part rather than in the middle of the century. Admittedly, Enville is one of the many places which are not all they used to be, but in a very distinct contrast to many of these, it remains a first-class place of large dimensions, and it is well kept up by Mr. Geo. Green, who has had charge of the garden for a good many years. The number of plants required annually even now for the filling of the beds still existing, is far beyond the quantity used in large establishments generally. Although the staff of assistants has been much larger than it is now, yet, the visitor need not anticipate to see the fact apparent at every turn. The bedding is done well, and in its style could hardly be excelled.

Riband borders, so fashionable once, may still be seen at Enville, where lines of golden and silver variegated Pelargoniums, running parallel with Ageratum, *Coleus Verschaffelti*, *Lobelia*, or taller subjects seem to be more attractive than formerly, because not so common. Carpet bedding has not the simple beauty that the herbaceous or alpine gardens, or even the riband border, presents, but when executed skilfully, and carefully looked after whilst growing, as it is at Enville, we must admire it, though even then rather as one would a picture than a garden scene.
